Message-ID: <01bc6e2a$289b9d20$0d6a09d0@ICNet.intercom.net>
Source record: 93560

Is this company still in business. Anybody know where I can find parts for
a Ham-M control box. I think I need a power transformer. I'd also
appreciate talking to anyone with experience troubleshooting/repairing
these rotors.
Thanks
Joe

Me, too... although not much interest on my part for 440, but definitely interested in a plan that talks about both a 6m and 2m J-pole.

I've thought about just trying to build a 6m J-pole and trying a second set of input coax to see what it'll do on 2m. I know it won't be great, but it might be worth a shot. Comments, anyone?

Halted Specialties Co. (www.halted.com) sell surface mount resistors
and capacitors. Minimum quantity for each value is 10 pieces. Cost for
pF range is $0.08 each . Capacitors are available in 0805 and 1206
case sizes. "Availability of different values may vary".
They publish a catalog which can be requested from their URL.

## 11. Equipment Without Schematics

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-01 00:00:00 UTC
From: aa1hb@juno.COM
Message-ID: <19970601.164320.6695.1.aa1hb@juno.com>
Source record: 93570

Recently Gary wrote
>I recently purchased the Alinco DM-1350 power supply. Alinco will not
>give out a schematic nor will they sell one.

Unfortunately, there are a number of manufacturers who are misguided in this respect. I wrote to MFJ for a schematic for my SWR Analyzer and got the same story: not available, you cannot even buy one.

Exactly what they think they are accomplishing by this policy escapes me. MFJ specifically states that a user who tries to repair a defective piece of equipment does NOT void the warranty, so they aren't trying to discourage us from fixing our own gear. That's good.

If they think they are inhibiting competition, please give me a break.Take the case of the SWR analyzer. Any potential competitor with $220 to spend can buy one of these boxes and reverse engineer it in about a day. I'm not a hardware engineer, but I don't think it would take me more than a week to design the same box from scratch: VFO, SWR bridge, frequency counter, none of this is exactly high tech and all the required circuits are readily available in the literature.

Why didn't I build my own in the first place? Because I felt the unit represented good value for the money; i.e., that MFJ deserves to make a profit building this unit so I can spend my time doing design projects that are more interesting to me. Maybe their concern is that a schematic would show that building one of these units is so simple that it becomes a weekend project with a FAR Circuits board and a few highly integrated components readily available from DigiKey.

>From my vantage point, this policy of refusing to supply schematics is just a nuisance for the end user. Anyone have another point of view?

believe it has been used by many amateurs in this part of the world,
but when you mention that it has never been popular with amateurs
you should say "US amateurs" because the main problem is that you
stick to yourself. Extremely seldom is a technical article from any
"outside USA " magazin referred to by QST, while most worldwide
magazines collect technical notes from all over the world..... so
don't blame us that you don't read any foreign magazines
I have just been reading through a half ton of worldwide magazines,
and I found some interesting notes in even the Japanese magazines,
but I cannot translate it, so I have to try to make up some text.
Apart from the scandinavian magazines I read QST, Radcom, Electron
(Dutch), CQ-DL, Radio-REF (French). I write a column for our national
magazine.

So, Jan, you think it's ethnocentricity (or xenophobia) instead of distortion that causes American amateurs to reject foreign designs. Perhaps, just to show that your argument is without flaw, you should publish here your measurements of the distortion characteristics of the G2DAF system so we can know--without any reservation--that your analysis is correct. The timer is running. You can start now.

The ARRL Radio Amateur's Handbook had some circuits like that. Check
your local library for an older handbook. The circuit hasn't changed over
the years.

Now why would you foolishly post this to alt.engineering.electrical?

It isn't very effective but I have been trying to ask BEFORE I buy,
whether a schematic comes with the device or can at least be obtained
later (and I try to hold it in my hot little hands and not just depend
upon "Oh yes, naturally we supply a schematic on demand. I burned my
fingers on that one already!) If you have a reasonable alternative
product which does offer customer support, like schematics and other
service literature, buy the supported brand!
In my opinion supplying service literature at a reasonable price
ought to be a legal requirement, for the sake of the environment, if for

no other reason. I would hate to guess how many pieces of electronics go to the scrap heap prematurely on account of lacking information. Up to a certain level of complexity the schematic ought to be included as part of the delivery of the product.
I have a monitor from a leading manufacturer who will remain nameless. It has a problem which could be solved far more easily if there were service literature for it. I have attempted to purchase schematics in three countries (and the company is well represented in each of these) and got nothing. In one case I ordered what the company's literature supply department found in a list and which sounded like the right thing, but for a lot of money I received nothing of value beyond some information which one could expect from the owners manual or sales literature. In fairness, the company took it back and the folks in all three countries have always been very pleasant about it all.
After a lot of this frustration I telephoned a service branch for the firm and was told THEY have no service information. They are not allowed to open the monitors but just send them to a central station for repair. Furthermore, I was informed that I could not send in the monitor for repair unless it was still under warranty or if I had a service contract with the company!!! If you don't pay your annual pound of flesh, scrap it if it goes bad!
If one does send the monitor for repair a replacement is received. It may be a repaired monitor from the central location but almost certainly not yours. If yours had 100 hours on the CRT and the replacement has 2000 hours, well, that's the system. It passed the tests!

## 21. SB1000 circuit diagram

Hi Folks,

Does anyone have a copy of the circuit for the Heathkit SB1000 single 3-500 linear. My instruction manual is missing page 70-72 and I want to modify it as I put the kit together to cover 6m in place of 160m.

I'll pay etc

Many thanks

Duncan

## 22. Re: Equipment Without Schematics

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-02 00:00:00 UTC
From: Marvin Moss <mmoss@gelac.mar.lmco.com>
Message-ID: <3392B7A3.1DC4@gelac.mar.lmco.com>
Source record: 93581

I could not agree more. However the problem I am having now is:

1) CCS has monitor schematics but at $40 each. This precludes me from trying to fix a monitor because most old used monitors are hardly worth more than $100 nowadays.

2) The throwaway phenomena is prevalent everywhere. I have two microwave ovens that need control panel repairs and I have had to spend countless hours making up my own schematics. The microwave people say that these are not repairable but they use discrete components and can, in fact, be repaired. I've done it but without a schematic it is certainly not cost effective.

3) A lot of IC's are numbered with house numbers rather than standard numbers. This is done because the part is the same as the good parts but with some minor spec reduced from the more expensive part. It is then renumbered for the manufacturer of the circuit board and is sold to him very cheap. It makes a nightmare to try to figure out what the part is.

4) I have several pieces of equipment where the manufacturer has sanded the part numbers off the top of the IC so I can not figure out the part number. Of course the guy is no longer in business so once again I have a piece of equipment that I can't even reverse engineer.

This is just a few instances of my frustration that perhaps you can identify with.

Marv

I recently purchased a surplus power supply at a company surplus store. It was unused, but with no literature. I am now trying to get applications literature on it from the manufacturer and have been unable to do so. Why, because I bought it for only $5, new and unused. I suppose their pride is on line. Or they are trying to discourage the surplus market? Maybae I was gave away too much info when I talked to their home office. Needless to say, I will never recommend their supplies to any client I have. Their boneheadedness is going to cost them $$$.

Why do I need literature to use a PS? This one can be used either as a constant current source or a constant voltage source or else its current or voltage output can be controlled by a variable input voltage. Some of the terminals have functions which are unknown to me.

Sorry, but that is incorrect. The G2DAF circuit was published here in
the early 70's. When it was published, I tried it in an HF amplifier
and the distortions was enough that I was firmly told to keep it off
the air.

When I made three tone distortion tests on the PA, IMD was terrible.

> Extremely seldom is a technical article from any
>"outside USA " magazin referred to by QST, while most worldwide
> magazines collect technical notes from all over the world..... so

>I have just been reading through a half ton of worldwide magazines,
>and I found some interesting notes in even the Japanese magazines,
>but I cannot translate it, so I have to try to make up some text.

As I said, it was published here.

Two years ago I was given a copy of the article by a PA manufacturer,
and asked to "check out" the circuit since the main limitation of
using cheap Russian tetrode was the expense of a good screen and bias
supply. When I re-did the tests, the results were the same.

If you have other data, taken with a stepped level two tone test or a
three tone test, I'd be happy to know about any successful details.

73, Tom

I was at dayton this year and FAR circuits had two booths under the tent
in the outer area. I purchased 10 or so PCBs. Therefore I assume they
are still in business.

QST for February 1983 had an article "Be Switched" page 18 on making high power switches from junkbox parts. It might give you some ideas if you can't find something commercial at a reasonable price.

Mint condition Drake R8A with Vhf converter board. Radio is about one year old. Comes with original manuals, original box, Rs-232 interface, Vhf converter (Drake), Scan-cat gold for windows. This radio sells for $1056.00 with out the Vhf converter which costs another $220.00. On top that you get scan-cat gold for windows with the radio. The price is $900.00 FIRM! If interested please email me here or call. Or, if in the Delaware Valley area, stop in and try the radio out! If you like, I will sell it to you with out the VHF board for $790.00.... You just can't beat the price. I guarantee there is nothing wrong with this radio or I will give you your money back....

Don't Wait too long... This is a top rated Radio in all of the SWL and Ham radio review books and Magazines......

Could also be the Military #.
We use 38501/###### 's all the time
the last digits indicate what it really is.
Unfortunately I'm laid off right now (can't get to the books).
But be advised, the last 5 or 6 digits in that series could
be anything from a diode to an IC.
The military in their infinite wisdom just used the next number
in sequence for the next electronic part they came across.
Good Luck
Bob

```
:
: I have one (and only one) piece of MFJ gear, a CW keyer that my XYL
:bought for me for Christmas.
:I called MFJ and told them they forgot to include a schematic. They
:said there was none. I said,
:do you think I am stupid? You made a PC board without a schematic?
:Send me one or it goes
:back to HRO.
:
: Three days later, I received a complete schematic in the mail from
:MFJ.
:
:
Good for you! This schematic stuff is just part of the continuing
"dumbing-down" of the amateur community, tacitly encouraged by the ARRL,
who profit from new equipment sales in the form of ad revenue. No wonder
the QST big-wigs get all defensive when people talk about buying surplus
and used equipment. Especially when you start talking about how good those
old tube rigs are!

Sample QST Review: "...oh its a wonderful rig. Incredible features! The
best sample of Japanese technology. Praise the Lord! for this chance to
put Americans out of work! etc etc etc" But what they don't tell you is
that you could build a rig yourself, esp receivers with better basic
performance for $200, minus the Pentium uP inside that controls the LCD
display :)

Rob.
```

I just updated my page 50.400AM page.

Sorry it took 2 weeks for me to add the calls from 5/23/97
What a nice opening it was!
Got in on it late but worked many stations up north.

I'll be on 50.400 today around 15:30(pdt)(22:30z) today for a few hours.
I'll call CQ every half hr. starting at 15:30 pdt.
Hope to catch some of you out there.

Go and check out the grids I worked on AM.
http://www.geocities.com/Hollywood/5860/50am.html

I'll keep adding to the list every week.

## 51. Coax Trap Information Wanted

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-03 00:00:00 UTC
From: dsnowden@ncdc.noaa.gov
Message-ID: <865360218.30272@dejanews.com>
Source record: 93517

A few years ago I read an article about building coax traps.
This was in QST I'm sure. I'd like a copy of it. I'll gladly
reimburse for copy/postage. I also remember (good memory for an ole fart)
that there was a VE that had a disk of software to aid in design
of these traps. I'd also like the callsign/address or a diskette
from one of you that no longer needs it (payment offered of course).
The story is that I moved to the mountains of MC from the
wide open spaces of FLA and need to compromise on antennas.
Besides it is fun to experiment.

From: Harry Lythall <acz732k@tninet.se>
Message-ID: <5n1rf5$48m$1@kalle.tninet.se>
Source record: 93521

Yep, I have loads of circuits on my homepage:

http://user.tninet.se/~acz732k/

This page will be updated weekly (about) with new projects and data. There are about 50 projects at the moment (excluding the other brewing) and there are plenty more that I have to find the time to 'digitize'.

I have had several requests for sending my project files over mail, but this takes an eternity as some projects have several files. I have therefore included a 'DOWNLOAD' section where you can download them all in a single 300K ZIP file. If you want to use them for your club magazine, projects etc. then please be my guest - download them all. I only ask that the info is given freely and without cost.

Hope you enjoy the homepage, and have fun with QRP although my page is not 100% dedicated to QRP.

73s de Harry

Yea, it's too bad we couldn't have a Volunteer organization like the
VEC's to confiscate equipment from pirates/outof banders/ jammers and
the like.

We could get lots of ham stations started in high schools with all the
nifty equipment we would be picking up.

## 66. Rodio Comm Rx Review/AOR AR-7030/Reviews in general/Anyone care what's in the box?/(Long)

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-03 00:00:00 UTC
From: stoskopf@tri.NET
Message-ID: <33939610.7BBE56CD@tri.net>
Source record: 93602

Technical Topics in the May 97 RadCom reprinted an updated list of receiver measurements as done by Sherwood Engineering. Those of you new to this hobby might not know that Sherwood and company have made many successful mods to the Drake R-4C, perhaps more than the Israel airforce to the F-4 Phantom, and still manages to keep the specs competetive. I have one of their XTAL filters for a homebrew rig and the Gaussian top to 12 dB gives an interesting flavor to CW. Hawker in TT has kept a string of comments on the Sherwood efforts running for over a decade and the latest rendition continues to add info with a mix of typically British commentary ("G3MOB writes:.....The Collins R390A is a superb example of mechanical engineering but is dreadful to tune and many professional engineers consider its AGC poor, indeed that Collins never got its AGC right in any of their receivers, whatever their merits elsewhere.") Similar pithy comments continue, but on with the subject:

With the caveat that newer RX like the IC-756 were not yet included, here is the top of the list as ranked by their 2 KHz results:

Dynamic Range at 20 KHz sp at 2 KHz sp

Drake R-4C/SF-600/6 (filter) suprise! 85 85

AOR AR-7030 100 82

Atlas 350-XL 81 81
*
Collins R-390A 81 79
*
*
*
WJ HF-1000 99 74
*

*
Drake R-4C stock 85 58

Obviously I left out many of interest, but what really caught my eye was that the top receivers as measured at 2 KHz all were in the 80s and 90s at 20 KHz except the AOR one. As a builder/dreamer/at least vouyer (sp?) of RX design, a look at published reviews was at hand.

Now if I were to look at an automobile review I would expect some comments as: 4 on the floor (yes that dates me), overhead cams, ported whatevers, turbo whatevers, fuel injected, etc.

June 97 QST, "AOR AR7030 Communications Receiver", p. 68...

"But in this case, with so much crammed into one small box-and the use of hex-head screws--it was a challenge I couldn't resist. And inside it is beautiful! A mixture of DIPs and surface-mount components sat on a shiny board with readable component labels. Looking for test point TP4? The label is fully visible, and not under a nearby component. Even the thickness of the metal case was impressive."

p. 70 "There's a block diagram,....but no schematic." Where's the diagram?

A three page review and nothing about the guts other than that it "is beautiful!"

Luckily the July RadCom arrived with a review by Hart:

p.45 "The receiver is a double superhet with IFs of 45 MHz and 455 KHz. ... A large signal bipolar RF amplifier is used with quad DMOS FET first mixer, dual FET first IF amplifier and high dynamic range IC second mixer." Fig.1 is the effective selectivity curve on USB which shows the osc sideband noise and IF filter response where it is easy to see where the 20 KHz characteristics develop.

This wasn't intended to be QST bashing, but a comment on the state of demand for technical info on the gear most of us use. The argument of course is that no one builds anymore...no parts, etc.

Strange that now as Beasley has the AF filters written for the PC and a standard sound card and Karn of TAPR points out that we don't need a dedicated DSP box when the newer PCs can have more firepower/horsepower for the buck (because of mass marketing) than we can afford DSP, we can/if we desire/ devote building to the RF interface and software is (nearly) free as W3IWI is wont to say, and the ability to see what the big boys do is fading away.

I picked up at Dayton several years ago, the SoftWave version of a DSP RX which is full of features and short on front end (and out of business!). Also there is/was the Comer RX/TX available with a similar weakness and less software (and cheaper).

The point of all of this (besides getting some frustration off my chest) is that I hope some of the members of the ham-homebrew list will occasionally encourage your national societies to keep the tech stuff in a bit. And if you haven't kept up with the TAPR DSP stuff, take a look at their WEB site to see what some are doing.

Sorry about the bandwidth, I feel better now!

N0UU

You are right Jan, and that is a shame! We could benefit greatly by
the contributions of articles and ideas from overseas ham magazines
like yours. A pity they are so hard to get in the U.S. and that QST
almost NEVER refers to them (for obvious reasons!)

However, I note that EEB in Vienna, Virginia DOES sell a FEW imported
ham radio magazines in limited numbers.

The Japanese magazine "CQ HAM RADIO" used to be a HUGE THICK
publication almost as big as "COMPUTER SHOPPER!!"

Like you, I couldn't read most of the texts in it but LOVED The
magazine!

Bry, AF4K / G3XLQ

Hi All,

I have a mini dual band wide band receive HT FS. I am asking $225. Works and looks like new (no scratches), Mars/Cap mod done.Includes box, strap, original 3" duck.
The specs are:

The Standard C508A

(a) 280 mW transmit power
(b) 60 memories; stores frequency, offset and CTCSS tones
(c) RX 100-180, 340-400 & 400-480 MHz
(d) TX Amateur bands 2M-70cm
(e) Store 2 M & 70 cm frequency in one memory
(f) Operates from 3 volts "2-AA" - Lasts weeks!
(g) Unsurpassed 0.158 micro volts sensitivity
(h) CTCSS Encode & Decode
(i) Scan 1 MHz, full range, memory, block, CTCSS
(j) Scan priority memory channels
(k) Scan pause, busy, hold
(l) One call channel
(m) Dual watch
(n) PTT lock
(o) One touch squelch-off button
(p) Battery save mode
(q) Automatic power off
(r) Rotary channel selection
(s) Keyboard lock
(t) Unsurpassed intermod rejection
(u) 1750 tone burst
(v) Dimensions: 3.35" (H) x 2.28" (W) x 0.98" (D)
(w) Weight with battery 5.65 oz

> filling the other 50% ...

The problem is that the handbook is following the inevitable trend in amateur radio: "less home-brew and more appliance operating". In the 50's, most (but not all) hams built a good portion of their equipment. There were a lot of cheap surplus parts on the market making it easy to construct receivers and transmitters of quality comparable to that which was commercially available. The handbook was extremely valuable for circuit ideas and "rule of thumb" design. The same applies to antennas and feedlines, etc.

In the 70's, with advances in technology everything changed. "Appliance" operating became the standard, 50 Ohm connectors, coax, and antennas that were purchased and put on the air in an afternoon. The emphasis shifted away from home construction, band-hogging AM, and rack cabinets. Too bad in a way, but technology marches on.

The handbook reflects this trend. Its not really "dumbing down"; its a reaction to becoming obsolete. Overall, Hams aren't as smart as they once were because the hobby now attracts people who are more interested in talking than in tinkering. Why take the trouble and build when you can buy? The ARRL has pandered to this notion to keep its membership alive.

The ARRL handbook always is useful, though there have been many times I felt it was too "cut and try".

By the way, teenagers in the 50's were not any smarter than today's teens. They were forced to meet higher standards, both intellectual and moral, however.

## 81. CB FM to 10M FM

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-04 00:00:00 UTC
From: Walter Crauwels ON4BCB <Walter_crauwels@qmserver.vtm.be>
Message-ID: <33956E15.492A@qmserver.vtm.be>
Source record: 93541

Hello All,

I was wondering if someone already changed a CB FM rig to 10M FM
As we have a 10M Repeater now,we are looking for lowcost rig
to work over the repeater.

Freq: 29.560 Mhz input and 29.660 Mhz output

Any information is welcome

73

## 82. Another neat RX and some questions about gain distribution and tracking (tube project)

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-04 00:00:00 UTC
From: BOB DUCKWORTH <bob@atl.org>
Message-ID: <339525CC.305D@atl.org>
Source record: 93542

No I didn't build it but am very happily working on someone elses
HBR-16. The Home Brew Receiver 16 tubes article from the Oct '59 QST
appears to have gotten someone so fired up that he had it built before
the Dec QST and the 5763 product detector mod.

If the Mosley CM-1 description bored you, stop reading now.

The Mosley had 5 tubes (actually 10 as there was a triode and pentode
in every one of them).

This HBR-16 has 16 tubes (actually 17 if you count the one 12AU7, 2 x
triode as two).

I don't know about RX design so I'm gonna ask some questions and
hopefully some will be kind enough to post what they know so I can get
this thing running in top form.

Circuit starts with a 6BJ6 Pentode as RF amp. Plug in coils for each
band. Antenna link coupled to grid coil which is tuned by one of three
sections of the 5-23mmf/section VFO cap. RF gain via cathode bias pot.

Mosley manual said triode amp is better on high bands owing to
noise considerations. Real feature or just making what they
used look good?

Output of the RF amp is coupled the same way (link to tuned grid) of
the first mixer 6CB5. Plug in coils are used here too with tuning by
another section of the VFO cap.

Any suggestions as to least aggrevating approach to making
sure all these plug in coil based tuned circuits track well?

The VFO, a 6BH6 is tuned by the third section of the VFO cap and also
uses a plug in coil. VFO feeds 1st mixer via same grid as RF amp.

How to determine best VFO injection level?

Output of first mixer is 1600kc and makes it's way to the second mixer
6BC5 via a link coupled, double tuned, transformer wound on a pill
bottle.

Here I'm curious as to how to determine whether ot not the
amount of coupling I have is right, too much, or not enough.
Would a 1600kc xtal (there is one in the junk box) be too
tight as a filter or attenuate the signal too much at this stage
of the RX?

The second mixer gets its' LO from a 1700KC 6C4 xtal osc. and is sampled through a 100kc double tuned IF transformer (Miller 612-M1) by the 6BJ6 first IF amp. Mixer gain via cathode bias pot.

Again, how to decide what injection level for 1700Kc signal is best.

Deja-vu, the second IF amp which is followed by the third of the triplet of transformers. The newly shaped IF signal is then routed to either a 6BE6 product detector or 1/2 of a 12AU7 double triode as envelope detector. Both IF gains are via one cathode bias pot.

As an operator, what is a good way to tell how much IF gain is enough.

BFO comes from a 6BH6 with Miller 012-M5 BFO coil and running as electron coupled osc.

Injection level question again.

The other half of that 12AU7 samples the output of the IF string and controls gain of the two 2nd IF stages for AVC and also drives the 6CB6 'S' meter amp.

Audio from either of the two detectors is amplified by a 6C4 driving headphones of a 6AQ5.

Hey, that's only 15 tubes! Well there is also a 6BH6 xtal osc running all by it's lonesome to provide a cal. signal.

So there. A bunch of gain distribution and injection level questions about a 37 year old radio. I'm all ears.

-bob

CBC International sells a kit (Super Expo Crystal Oscillator and Mixer) that will allow you to convert many CB radios to 10 meter use. It also allows for tx and rx splits. You can contact CBC International and get a catalog by sending $2 US to CBC International, PO Box 31500, Phoenix Arizona 85046, USA.

Take a look at the late '70, early 80's 73 magazines, there were several
articles concerning CB to 10 and FM conversions.

## 85. Bendix/King AN/PRC-127 LPH VHF RADIO 14 CHANNEL

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-04 00:00:00 UTC
From: hhmercer@airmail.net
Message-ID: <865432827.13245@dejanews.com>

Cross-posted to: rec.radio.swap,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.amateur.homebrew,sci.electronics.misc,sci.electronics.equipment,sci.electronics.repair

We are a small Police Department in Texas. We have 20+ Bendix/King AN/PRC-127 hand units. These units were procured from the military for use by tactical officers.

Bendix/King is unwilling to talk about these radios other than the fact that they acknowlege they exist. It is very frusterating - makes one want to think about a boycot.

We have no real budget at the department and these radios have filled a void that otherwise could never have been accomplished.

I have heard of several modifications that can be performed on these units. I am seeking information on any and all modifications that can and have been done to these radios. Such as installation of the high/low power switch, installation of the scan switch, etc. . .

Also seeking anyone that has accessories that they would be willing to sell or donate (for tax write off) for these units.

Anyone with information on these units please e-mail me at hhmercer@airmail.net

Thank You

Sgt. Lindsay Hodgdon
Lone Oak Police Department
Lone Oak, TX

Anyone with any information of the AN/PRC-127, I am interested in visiting with you. Anyone with information about the AN/PRC-127 (A), Please let me know what the revision (A) is . . .

I have found just about any hamfest that has somebody selling CDROMs has a couple of choices. I recently bought the "InfoMagic LINUX Developer's Resource" for $12. It contains RedHat 4.0, Slackware 3.1, and Debian 1.2 kernals. Plus X-Windows, and an enormous amount of software and on-line documentation (6 CDs). Installation was simple by making a boot disk from a dos machine. (I prefer the RedHat as it needs only a single boot/install diskette). I now have a cool X-Windows interface, AX.25 on packet radio, Web Server, FTP server, Telnet server, and much much more. Hard to beat that price for all the neat stuff!

```
Since the L.O.S.A is getting bigger I only post the index of
applications to the Usenet groups and you can download the
complete L.O.S.A from the following places...

WWW:

http://www.hth.com/losa.htm

FTP:

ftp://ftp.parallaxinc.com/pub/text/losa.txt

1.0 Whats is L.O.S.A all about ?
--------------------------------

I started to compile L.O.S.A because I know there are lots of great
ideas and many problems that are solved with the BASIC Stamp and the
main purpose of this list is to get an idea of what other people are
using their BASIC Stamps for and maybe get some inspiration or hints.

1.1 How can I contribute to this list ?
---------------------------------------

If you have done something (big or small) with the BASIC Stamp that
you are willing to tell others please use the form given below and
write a short description, nothing fancy is needed just a simple
explanation. If you have source code to share that's even better but
it's not necessary.

Visit the following Web site and fill in the contribution form...

http://www.hth.com/losa.htm

## 92. What voltage to float deep-cycle RV batteries?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-04 00:00:00 UTC
From: swithrow@nyx.cs.du.edu
Message-ID: <5n5ce5$nlp@nyx.cs.du.edu>
Source record: 93552

What is the correct voltage to float the deep-cycle RV or marine
batteries that you get at Sears or WalMart? I am using them as
emergency batteries on a radio system such that they are used only
when the power goes away (rarely), the rest of the time they are
trickle charged.

Any good references on this subject would also be appreciated.

Hi All,

I have a Yaesu FT-747GX to sell. Covers .5-30 mz, all-mode AM,CW,SSB, and FM with optional accessory. Its "as new" in the box not a single mark on it. I would like to get $500.

BTW- I just got a old issue of CQ (1992) and there is a remote mounting mobile kit one can get for the FT-747GX.

>Regards

I don't suppose anyone knows of a program/kernel/etc. that will
connect to a Netware 2.12 server? (I know about ncpfs but it appears
to only support NW3 and greater)

Is Wine now reliable? I've got a copy on a Yggdrasil CD set I bought
at Dayton last year but it warns in many places of instabilities in
Wine. Right now, I'm planning on simply setting aside 25% of my hard
drive for a DOS/Win3.11 partition. "lodlin" works great, allowing
easy switching between OSs, especially with the DOS partition mounted
on the Linux side too.

## 95. Kenwood PC-10 Phone Patch to Yaesu FT-1000

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-05 00:00:00 UTC
From: Dale Martin <kg5u@hal-pc.org>
Message-ID: <01bc716e$442751a0$481a10d1@dale>
Source record: 93408

I have a need to hook up a friends Kenwood PC-10 Phone Patch to our club's FT-1000.

Can someone tell me what the pin-outs of the jack and plug on the phone patch are?
I am certain they are the microphone connectors, allowing the mic to be connected to
the patch, then the cable connected to the radio mic input.

The microphone connectors on the phone patch (jack on the pp cabinet; male on the
cable (to the radio). They are both 4-pin connectors.

The purpose, in case you want to know, is an astronaut has met some U.S. Fish
and Wildlife biologists on a couple of small islands (reefs?) between Midway and
Hawaii, called French Frigate Shoals. They have a small, low power, solar powered
crystal controlled transceiver and a vertical antenna. The astronaut has told them
he would see about getting our club station (W5RRR - Johnson Space Center ARC)
set up to be able to provide them phone patches home (they'd be using their calling
card numbers from JSC to their homes). It's an iffy proposition, but worth a try at least...
these folks are living in tents on the islands and won't be getting off for months yet.
The astronaut (a ham) has acquired a MARS callsign for the club and a MARS
callsign has been assigned to the USF&W folks on the island.

I have been tasked with interfacing the Kenwood phone patch with the Yaesu FT-1000.

Any help would be appreciated.

Thanks and 73,

The only thing I know of that would refer to what you're asking for is
MiniLinux by sp2ong.
It can be downloaded from ftp.li.ncu.edu.pl from the directory
/pub/hamradio or something.
It works out of the box and gets installed on a msdos partition.

swithrow@nyx.cs.du.edu (Skip Withrow) wrote:

Amp.Hr. Capacity (in amp-hrs)/100 is standard trickle for lead-acid batteries.
A 1 Amp 12V wall-wart will probably do just fine. I used one of the Radio Shack Variety for several months during Desert Storm, as we had to improvise our power supplies.

For example: an 8D battery is 195 A-H. You can trickle it at

195/100=1.95 Amps without excessive gassing.

In practice, I would use maybe 1.0 - 1.5. Don't get any sparks near the vents though, or you'll soon find out why if you survive.

Battery manufacturers tend to exaggerate capacity, with all sorts of different "cranking amps" and meaningless stuff like that. Write to the manufacturer and ask for their "9 hour discharge curve" to get the real figures on how the battery will perform during actual emergencies. If they don't give it to you, don't buy it.

"True" standby batteries are expensive, and use Cadmium in the plates.

If you keep the batteries in the shack, I recommend keeping them in a fiberglass or other acid-resistant case.

Another important thing to do (which most people don't) is to periodically take the battery outside, and wash it well in a stream of running water, while brushing with a soft brush. This removes all traces of acid which have vaporized out of the vents and settled on the top of the battery. This always causes a current path between posts (you can actually measure this with a digital voltmeter). Keep the battery clean, dry, charged and "watered" and it should last for some years.

Date: 1997-06-05 00:00:00 UTC
From: Scott Sidener <sidener@umr.edu>
Message-ID: <5n6r22$i0o$2@news.cc.umr.edu>
Source record: 93415

Hi,

I am trying to tune up 3 motorola mitrek radios in the ham band.

I have bought crystals for the channel elements and know that if the freq. changes significantly then at least one cap and one inductor need to be changed in the channel element to get the crystal to oscillate.

I believe this is called "compensating"

Can anyone prescribe what to change in the channel elements to work?

Here is what I have:

Original New
Channel Freq.
Freq.

168MHz 145MHz Both Tx and RX kxn1088 and kxn1086
460MHz 440MHz Same as VHF
46MHz 50MHz Kxn1085 and 1087 I think.

Any help would be greatly appreciated.

Thanks,

Scott Sidener N0WFL

..

I won't disagree with what "Old Buzzard" wrote...I think there's good advice there. But I'd add a couple points I've gotten from asking similar questions:

First, it's good to _occasionally_ charge the battery to the point of vigorous gassing, generally around 14.2 to 14.5 volts for a 6-cell "12V" wet cell battery.

Second, if you want to float-charge to a _voltage_, about 13.4 volts is good. The current should be very low, but, I am told, charge will be maintained. If you want to top the battery off just before use after being floated at a constant voltage, it doesn't take long at all, since it's pretty near full charge anyway. Gassing normally begins at about 13.7 volts, so you're below the point of any significant gassing at all at that lower voltage. -- You can determine a good float charge voltage by charging the battery to the point of vigorous gassing, then removing the charger and letting it "rest" an hour or so. Measure the voltage (no load but the volt meter), and that should be a good "float" voltage.

Finally, the voltage numbers are temperature sensitive...the numbers I gave assume you're within 10 or 20F of "room temperature", say 50F to 90F. You'd want to start adjusting them if you want to operate outside that range. The currents that Old Buzzard gave should be independent of temperature.

Has anyone ever made his own plug-in units for this powermeter?
They are extremely expensive over here, and purchase from USA was not too inexpensive after all. I have seen some cheap offers in UK some years ago, but they are not very much cheaper in UK now.
I have already 1W probe for 175MHz, 10W probes for 175 and 470MHz, 150W for 175MHz, 50W for 1000MHz. 250W for HF
I would need some possible probes for 2,3GHz (10W), but since my interest cover large frequency range I would be interested in any experience made. I also contribute to write a technical information column in our national amateur radio magazine, and send technical notes to G3VA and PA0SE for respective magazines

hi
Believe you may want to see some original paper on the design?
in case you are not, see ART by G3VA which shows several constructions
of Vackar oscillators, this is often mixed up with the Seiler
oscillator, and even more with the Tezla oscillator. Either Vackar and
Tezla sound czechoslovacian(OK) to me. I believe the latter is also a
company name in OK. I believe I have read an article in CQ magazine in
the early 60's on this type of oscillator.

MZenier@netcom.com wrote:

[deletions]

>It is a shame that they wimped out on the math.

[deletions]

As the handling editor for that 1995 ARRL *Handbook*'s oscillators chapter and the handling editor and coauthor for its mixers/modulators chapter, I disagree that that ARRL "wimped out" on the math, especially in the mixers chapter, a considerable portion of which I wrote. The ARRL Handbook at no time in its history has been a radio *engineering* handbook, and it did not, and was not intended to, become one with its 1995 update. Thus, it contains only the math deemed necessary for completeness, as opposed to exhaustiveness. And notice that even that relatively modest dollup of math--part of it equations that prove that the "carrier" does not vary in AM--has not dispelled the popular idea that the carrier does vary.

Why don't people believe the words--that the carrier doesn't vary? Because their nonengineering intuition, aided by the misleading and poorly explained oscillograms long carried in just about every ham technical handbook, tells them it does. Why doesn't promulgation of the math correct them? Because math is an abstract language that they don't speak, or don't speak well. Why don't they speak math? Because they are not engineers, and have no real need to speak it.

Amateur Radio is not, and has never been, a primarily technical hobby as practiced by most of its constituents. (Many readers of this newsgroup would like to believe it is or was it some time, but the evidence of history proves otherwise.) Merely building radio equipment guarantees the acquisition of radio engineering knowledge by its builders no more than constructing club sandwiches confers knowledge of nutrition. Radio amateurs are *hobbyists*; they are passing time by working and playing with radio. The ARRL *Handbook* is written to be accessible by as many hobbyists as possible, not just those who aspire to radio engineering, with or without a degree.

I wish the *Handbook*'s foreword included text that used to be there, text that characterized the book's intent to convey the latest practical radio advances "reduced to amateur practice." Perhaps this, from the foreward of the 1949 edition, can serve:

"This wide acceptance of the *Handbook* is founded on its practical utility, its treatment of radio communications problems in terms of how-to-do-it rather than by abstract discussion and abstruse formulas."

That said, I consider David Stockton's oscillators chapter to be an delight, and absolutely the best general treatment of oscillators in Amateur Radio publishing. And I consider the mixers/modulation chapter to a triumph in the sense that it conveys, for the first time in an Amateur Radio handbook, the concept that mixing, modulation and demodulation all depend on one phenomenon: multiplication (all right: or convolution :-D) due to nonlinear distortion. That had never been stated in an ARRL *Handbook*--and it was clearly overdue, as the response of one long-time ham and engineer to a related writing of mine on synchronous AM detection (I paraphrase): "What do you mean, 'the carrier heterodynes the sidebands back to audio'? I checked my Terman, and he said nothing about heterodyning--only that the mechanism is rectification!"

Regards,

David Newkirk, W9VES

CQ of June 1994 pp 26 has an excellent article on the Vackar VFO and some theory. See also QST for Sep 1978, pp15 for an article "Meet the Remarkable but Little-Known Vackar VFO". This was also reprinted in QRP Classics, ARRL, 1990 pp 119. The original article by Jiri Vackar "LC Oscillators and Their Frequency Stability" was published in the Tesla Technical Reports(Czech) in Dec of 1949. These references are from the CQ article.

I started playing with linux since Linus first offered it for ftp and I
have been a devotee ever since, the way it has advanced still amazes me.
I couldn't see any other outfit putting AX25 into their Operating
System.
Like you I do everything on a linux machine, work and play. The
dosemu(lator) and Wabi and Wine allows me to handle the EXCEL, Word6 and
PowerPoint stuff I get thrown at me. All this with no rebooting, all my
other stuff like X3270 via ppp into our Corporate mainframe and pdf docs
work fine.
Regards

>
>73's Hartmut, DF6PW
>waldner@uni-bonn.de
>

Penta Labs tubes were relabeled surplus Eimac's. Most were from a
batch made in the 80's, when Eimac was having heat dam problems in the
tube. Avoid ANY 8877 code dated in the 80's. Many runs were prone to
cathode-grid shorts and gold sputtering.

Because of the re-labeling of tubes (some were sold with Eimac's name)
Eimac had to start stamping their logo and name in the metal.

Beware of the bargin tubes, and avoid Penta.

## 117. 3-gang variable capacitor

## 118. MONEY FAST AND E ASY

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-06 00:00:00 UTC
From: wasted187@aol.com
Message-ID: <19970606003000.UAA03860@ladder02.news.aol.com>
Source record: 93428

A while ago I was reading through a letter similar to this one
and thinking to myself yeah right. Making thousands of dollars
off
of a $5 investment, no way but after reading several I decided
to
give it a try and believe me I've never looked back. I figured
what have I to lose but a couple of stmaps and 5 bucks. Still
before anything I made sure it was
all legal as you may by calling the US POST OFFICE
(1800-725-2161)
It turns out the process is completely legal and very simple.
Withing a
week I began getting money and it didnt stop.... I was thrilled
to
have
recieved $30 after my first week abd even more so when after
the
second week I had brought in over $1000. I dont know about you
but I could definitely use the money. The process is very easy
and
has 3 simple steps:

STEP 1: Get 5 peoces of paper and write the following at the
top
of each
"PLEASE PUT ME ON YOUR MAILING LIST"
now get 5 one dollar bills and place ONE inside of each of
the
sheets of paper. Place the sheets of paper into five seperate
envelopes and seal them. You should have 5 envelops each with a
sheet of papaer and 1 dollar inside. Mail the envelopes to the
following 5 adresses:

1. Scott Hilterbran
222 W. Pleasant St
Hillsboro, OH 45133

2. Paul Mewes
5550 Fillmore St
Merrillville, IN 46410

3. Scott Brkovich
2251 Sandhurst Drive
Castle Rock, CO 80104

4. Abalou Bodjona
2706 Nueces, Apt 214
Austin, TX 78705

5. Marchello Ferrara
3412 Norton St
Hopewell, Va 23860

STEP 2: now take the # 1 name off the list and move the other
names up ( 2 becomes 1, 3 becomes 2, etc.) ADD YOUR NAME AS
NUMBER
5
ON THE LIST. Change anything you need but try to keep this
letter
as close to the original as possible. Now post your amended
article
to at least 200 news groups. There are close to 18,000 and you
only need to send to 200 so it wont be hard. REMEMBER YOU CAN
SEND MORE THAN 200 & THAT THE MORE YOU SEND THE MORE MONEY
YOU
WILL MAKE! Now here's how to post to newsgroups.

FOR NETSCAPE USERS:

1. click on any news group. then click on "to news" which is at
the top left corner of the news group page. this will bring up
a
message box.

2. Fill in the SUBJECT with a flashy title that will get people
to
read your post like this one.

3. Now go to the message part of the box and retype this
letter
exactly with the exception of adding your name and adress at
number 5.

4. When done SAVE YOUR ARTICLE! DONT SEND UNTIL YOU SAVE IT!

5.Now that your letters saves go ahead and send your first
copy!
(click
on the "send" button in the top left corner.

6. This is where you post all 200 or how ever many you plan
to
post.
YOU MUST POST AT LEAST 200 TO MAKE GOOD MONEY!!!!!!!!!!!!!!!!
Go to any news group article and click "to news". type in your
flashy subject name in the subject box and place your cursor in
the message
box, Now click on "attachment" click on attachment file and find
your letter where evere you saved it. Click on your file and

click
"open" amd then on "ok". You should see your name shaded in the
attachment box. NOW POST AWAY!!!!!!!!

FOR USING INTERNET EXPLORER:

Its just as easy. HIGHLIGHT THIS ENTIRE ARTICLE and press "CTRL"
and the "C" key at the same time to copy this article. Then
print
the article for your records. NEXT go to the news groups and
press
"post an article" type in your flashy subject and click the
large
window
below. Press "CTRL" and "V" and the article will appear in the
message window. **BE SURE TO ADD YOUR NAME AND ADRESS TO THE
COPIES YOU SEND**********
Now re-highlight and re-copy for each news group. It was tricky
for
me at first but after the first few you'll be sending post in
less than 30 seconds!

Thats it. YOU WILL BEGIN RECIEVING MONY FROM AROUND THE WORLD
WITHING DAYS SO MUCH THAT YOU MAY EVENTUALLY NEED A PO BOX TO
HOLD IT ALL.....
If you wish you can remain anonymous just be sure your adress
is
correct.
Once again this is all totally legal and a great way to make
money so give it a try, at worst you'll be out 5 bucks and a
few
stamps.....
BUT I PROMISE YOU WILL MAKE MORE, A LOT MORE, AND ONCE
THE MONEY COMES IN YOU WILL WONDER WHY YOU EVER WAITED
TO START DOING THIS!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
Happy
money making.Think about all the honest people online every day,
getting a dollar from 5 percent of them would be a tremedous
sum
of money. But still the choice
is yours. I wish you the best and hope you will take this
opportunity to better yourself finacially and have fun doing
so...

## 119. The NorCal 38 Special/such a deal

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-06 00:00:00 UTC
From: jparker@fix.net
Message-ID: <5n7mdk$qqu$1@zinger.callamer.com>
Source record: 93429

Over 2500 38 Specials have went out so far.

This CW rig comes with some very intersting features.

300 to 350 Mw transmitter and great specs.

With just a few parts and simple mods you can add a 5 watt amp to the
already on board circuitry.

With just a couple of more parts you can add the TiCK 1 or 2 keyer
to the already on board circuitry. These can be seen at
http://www.vivanet.com/~gmdsr

Once you have the rig up an running you can mod the dickens out of it
which you look at off the NorCal Page: http://www.fix.net/norcal.html

Finally when your really ready to put the real finishing touch to your
new creation go to "Creative Enclosures" page and look at the
fantastic enclosure available from San Luis Machine:
http://www.fix.net/~slmachco

Enjoy,,,72,,,Jerry...WA6OWR...K

ps...yes the rig is convertable to 40 meters.....

## 120. Re: Which QRP Kit?

## 121. Waveguide Component Construction Question

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-06 00:00:00 UTC
From: mds@lexis-nexis.com
Message-ID: <5n7q9g$c0@mailgate.lexis-nexis.com>
Source record: 93431

I have a question concerning waveguide construction that I hope someone in this group may have some knowledge. I want to do some experimenting with 10-Ghz microwave components. One limiting factor is the availability of waveguide components (at least in the ham's price range). Surplus components are available, but never when I need them! I began to look for ways to construct the components I need. These items may include waveguide to coax terminations, gunn oscillator housings, directional couplers, mixer housings, slotted waveguide measuring devices, antennas, etc. While 3/4" copper water pipe has been used for some of these items; I wanted to use rectangular waveguide materials. Attempting to locate rectangular metal tubing with the dimensions of WR-90 was not successful.

I then thought about making these items from sand mold castings. While this is a hot and dirty process, some very nice metal parts can be made this way. Various metals can be used. This brings me to my question. The problem I have observed with sand castings is surface roughness. How smooth must the inside of various waveguide components be? I would appreciate hearing from anyone who has any experience or thoughts in this area.

## 122. Re: Waveguide Component Construction Question

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-06 00:00:00 UTC
From: "Barry L. Ornitz" <ornitz@tricon.net>
Message-ID: <01bc7237$03a2cd20$237fb0cc@ornitz.tricon.net>
Source record: 93432

It is best if the inside surface is quite smooth. Have you thought about buying a length of waveguide tube and cutting pieces for your components? Five or ten foot sections are not expensive. You can add the flanges yourself.

73, Barry L. Ornitz WA4VZQ ornitz@tricon.net

As the subject line says, we need info on the Darcom 9000. Specifically a copy of the service manual is needed, and programming information for the EPROM is required. Anyone have anything?

This is a 928 to 952 MHz duplex radio which we want to move down into the 902-928 MHz band. We already know the front end filters won't tune down into the range, but we have alternative filters available. We just don't know how to reprogram the frequencies.

Mike Suhar <mds@lexis-nexis.com> wrote:
>The problem I have observed with sand castings is surface
>roughness. How smooth must the inside of various waveguide
>components be?

Yes, the smoothnes of the inner surface is very critical.
While it may be a good idea to cast flanges, wave guide
must be properly extruded.

However, since wave guide components have by now become obsolete
even for most amateur applications, there must be many hams, who
would be happy to get rid of some wave guide components (like myself).

May be you want to place an ad in a magazine?

## 126. a way to reduce powerline interference buzzes

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-06 00:00:00 UTC
From: wa2ise@netcom.com
Message-ID: <wa2iseEBCCxC.EC3@netcom.com>
Source record: 93436
Cross-posted to: rec.antiques.radio+phono,rec.radio.amateur.homebrew,rec.radio.shortwave

A possible solution to QRN, RFI from the powerline (that annoying buzz all over the band): I removed the switching power supply transformer from a dead video terminal (Wyse "VT100"'s). These transformers have a set of primary windings, a low voltage secondary, and a higher voltage secondary. Identify the primary (look at the circuit board you pulled it from), measure resistance, and look for a secondary with similar resistance. AND be sure the primary and secondary are NOT connected together! I wired a power cord to the two windings, one leg to the primary, other leg of the power cord to the secondary. And the outlet side connects to the other ends of the primary and secondary. And try it on your radio to see if it supresses the buzz or not. (If not, try reversing the connections on the secondary).
One way to see if this is worth attempting is to listen to the radio as you pull its plug from the powerline. If the buzz stops before the radio's power supply looses its charge in its filter caps (a weak radio station should suddenly have improved S/N), then the RFI is conducted mainly by the power cables. In which case the "insert a choke coil in the line" trick should help. It takes more than a few turns around a ferrite core, however. You need a few millihenries of inductance.

## 127. Zenith BC-221-T Frequency Meter as new

## 128. Mailloop: How to do Bulk Maillings

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-06 00:00:00 UTC
From: assd
Message-ID: <5n8mke$fr8@newsfep1.sprintmail.com>
Source record: 93438

Mailloop v3.0 is an industrial strength bulk mailer.

Mailloop v3.0 is a bulk mailing program for the internet. It can take a single message and broadcast it to either a listing of e-mail addresses or to a listing of newsgroups. Creates custom newsgroup lists by filtering NNTP servers. Creates custom e-mail lists by extracting them from newsgroups. Can also extract e-mail addresses or newsgroup names from other protocols. Built-in NNTP, SMTP, POP, FTP, HTTP, EXEC, CGI, WHOIS and FINGER clients. Anti-cancelbot feature. Automatically processes remove requests. Includes extensive on-line help.
The most powerful bulk mailer available. Requires Windows 95 or NT 3.51+ and internet access.

The "Program" Mailloop is only available in English.

For more info goto: http://205.199.4.219

http://205.199.4.219

Using it is easy:

1) Create a message ( http://205.199.4.219/editor.htm )
...by using the pull down menus or
...by using any editor

2) Create a newsgroups list ( http://205.199.4.219/news3.htm )
...by filtering an NNTP server or
...by importing from any text file or
...by manually creating with any editor or
...by extracting from any FTP file or
...by extracting from any HTTP file

3) Create an e-mail list ( http://205.199.4.219/em3.htm )
...by extracting from newsgroups or
...by importing from any text file or
...by manually creating with any editor or
...by extracting from a WHOIS response or
...by extracting from a fingering response or
...by extracting from a UNIX response or
...by extracting from any FTP file or
...by extracting from any HTTP file or

4) Broadcast the message
...to the e-mail list or ( http://205.199.4.219/embc.htm )
...to the newsgroup list ( http://205.199.4.219/ngbc.htm )

5) Then process the remove requests
...by using the mailbox processor ( http://205.199.4.219/pop.htm )

6) If you want you can use the Newsletter Sever
...The Newsletter Sever will allow you to have an topic-specific newsletter that other can subscribe
and unsubscribe to.
...Customizing this server response files ( http://205.199.4.219/response.htm )
...Creating a new newsletter ( http://205.199.4.219/create.htm )
...Creating and Updating a newsletter the actual newsletter ( http://205.199.4.219/update.htm )

For more info visit http://205.199.4.219

http://205.199.4.219

Source record: 93440

Hello,

I have some questions about power tetrodes. I am building a (Svetlana) 4XC400A based VHF/UHF linear and don't know exactly, which parts of the tube have to be protected and in which kind.
Now: whats happening in the unpleasant case of arc?
Technically, the current flows from the plate to ground. Physically, the electrons flow from ground (cathode), through grid and screen to the plate.
Now, what potential/current do You see at grid and screen?
Are these grids robust enough to survive a current of 50A flowing though them?
The plate current is cut off in less than 30ms (milliseconds) in my design (or at least it is intended, that it does...)
Most protection circuits use a 25 to 50 Ohm resistor in the plate line (limiting the current to 50A in the case of a 4XC400 with 2.5kV plate potential). The screen is fed (in some designs) from a z-diode stabilized power supply with current limit (20mA with the 4CX400). To avoid destruction of the screen in case of reverse current (which seems to be 'normal' with tetrodes) a shunt resistor (100k to 220k) and sometimes a ZNR (surge voltage protector) to ground are used.
At a screen potential of 400V a 220k resistor would only limit this voltage up to 1.8mA (the 4CX400 has a forward screen current of 20mA, any ideas, how big the reverse screen current may be during normal operation?)
The surge protector does not limit the reverse screen current at all. Is this a problem? (screen dissipation with the 4CX400 is 8W)
Most designs I have seen only protect the grid with a rather high (>200Ohm) series resistor. For normal use, this is not a problem, because grid current is very low, but if the tube is arcing, what happens with negative bias (which cuts off the tube? Do I have to protect the grid to become positive e.g. with a diode shunted to ground?

Maybe I am to concerned about tube protection in case of an arc, but on the other hand I'd be interested about this point.
Any recommendations for books/appnotes/etc about RF power tubes?

Thanks for any information.

Regards and best 73

Robert (HB9NBY)

The exact dimensions aren't critical, unless you need a
specific waveguide impedance. Tuning out a mismatch could
be as simple as adding a tuning screw or two. Thus, you
might look at the available rectangular sections and
calculate the useful ranges of what you can get. WA5VJB
found that the loss of bolting different types of 10 GHz
waveguide together was very low, even though it must have
looked awful.

Surface roughness increases the loss of the waveguide, which
may or may not be a problem for typical amateur applications.
For instance, according to my calculations solder in waveguide
isn't a big deal, since amateur power levels are low and the
length of guide involved is short (10s of watts at most and cm
of guide).

> I then thought about making these items from sand mold castings.

> experience or thoughts in this area.

I have a pair of cast waveguide bends, though I don't know
the particular casting technique. The surface is certainly
a lot rougher than a nice milled surface.

A technique I hope to try at higher frequencies is to mill
slots in aluminum or brass stock. I don't know yet whether

it makes more sense to mill mirror images or to just cover
the slot with a cover. This might be a good way of making
waveguide bends.

The arc current flows from the anode (HV+) to the nearest low-potential
object. In the case of a tetrode this is usually the screen grid.
From there, the current finds a return path to the HV-minus rail, so it
can involve the screen supply, cathode and sometimes the control grid.

Arcs can occur both inside the tube and outside.

>Now, what potential/current do You see at grid and screen?
>Are these grids robust enough to survive a current of 50A flowing though
>them?

You can see potentials of a few hundred volts, and the internal
electrodes will not survive currents of 50A or more for very long.
Neither will the power supplies. Therefore you have to do two things:
1. limit the arc current; and 2. remove the HV as quickly as possible.

>The plate current is cut off in less than 30ms (milliseconds) in my
>design (or at least it is intended, that it does...)
>Most protection circuits use a 25 to 50 Ohm resistor in the plate line
>(limiting the current to 50A in the case of a 4XC400 with 2.5kV plate
>potential).

This resistor is ESSENTIAL! There will be almost 2kV across the resistor
for a few tens of milliseconds, so it must be a high-power (50-100W),
high-voltage type which will not arc internally.

Also essential is some method of detecting the arc and removing the main
supply to the HV transformer. A mains fuse is not fast enough.

>The screen is fed (in some designs) from a z-diode
>stabilized power supply with current limit (20mA with the 4CX400). To

>voltage up to 1.8mA (the 4CX400 has a forward screen current of 20mA,
>any ideas, how big the reverse screen current may be during normal
>operation?)

You are confusing two different things here. One is the arc protection, which is the function of the surge voltage protector (spark gap or Metal Oxide Varistor). The other thing is the forward and reverse screen current in NORMAL operation. Let's finish talking about the arc before going on to normal operation.

A surge voltage protector between screen grid and ground is very good value for money. It prevents the screen from rising to a very high voltage and drawing destructive amounts of current, and it also protects the bypass cpacitors in the sockets (which can be more expensive than the tubes!).

>The surge protector does not limit the reverse screen current at all. Is
>this a problem?

The surge protetor is not intended to limit screen current in normal operation. The turn-on voltage must be about 50V above the normal screen voltage.

>(screen dissipation with the 4CX400 is 8W)
>Most designs I have seen only protect the grid with a rather high
>(>200Ohm) series resistor. For normal use, this is not a problem,

Yes, it is a problem! This so-called "protection" resistor means that when the screen begins to source reverse current (which is quite normal for tetrodes), the screen voltage will rise because of the voltage drop in the resistor. This will make the screen source even more reverse current, which will make the voltage rise even more, until - BANG!

The screen grid supply must be able to hold the voltage very constant under conditions of either positive or negative screen current. This usually means a shunt voltage regulator.

>because grid current is very low, but if the tube is arcing, what
>happens with negative bias (which cuts off the tube? Do I have to
>protect the grid to become positive e.g. with a diode shunted to ground?
>
Not in my experience. It is unusual for an arc in a tetrode of the 4CX250-400 size to damage either the control grid or its power supply.

>Maybe I am to concerned about tube protection in case of an arc, but on
>the other hand I'd be interested about this point.

You need to think about the whole problem much more carefully, and get some more information.

>Any recommendations for books/appnotes/etc about RF power tubes?
>
Chapters 6 and 11 of 'The VHF/UHF DX Book' contain a lot of information on this topic.

(I'm running a 2-4CX250BM amplifier right now, with 2.8kV off load. Because I've been cleaning the shack, there is an occasional arc as dust particles pass by the anode. Excess screen current trips a relay and removes the mains from the HV transformer. Because there is a HV limiting resistor and VDRs on the screens, the amplifier comes right back on-line when I press the Reset button. No damage, no drama.)

Anyone going to a California hamfest soon? I understand that the Halted company has previously sold Pixie kits for $5 at their nearby swap meets.

If you know of a Halted appearance at a swap meet soon, I'd like to arrange
to purchase a few pixie kits! (I originally tried to order direct from Halted, but they only ship UPS, which means I pay big $$$ in brokerage fees
at the Canadian border.)

Please email me if you know (or think) you may be encountering Halted at a
swap meet, and we can make arrangements. Besides having the satisfaction of
helping out a fellow ham, your efforts will be rewarded with a complimentary
Pixie kit (Retail value $8.99! Don't wait! Act now!)

My 1974 handbook has a full page on how to construct the
N connector. Also, I've built these and shimmed for
pin depth etc. (Yes I've used them....)

The part you speak of is compressed between a metal washer
and the threaded end cap. Unless you have a different
part than I do. Spec'd to 18 GHz, these usually run
about $17 to 25 dollars each.

: metal tubing with the dimensions of WR-90 was not successful.

Mike,
I published a 10 GHz waveguide filter design in the July 1987 edition
of QEX. Pictures of the filter are on the cover. In addition to using
standard guide, I also tried fabricating one using double clad printed
circuit board soldered together to produce "home made" wavequide and
reported that on page 4. The resulting filter had more loss but was
still tolerable.

I just sheared some board material and soldered it together around a
rectangular form made to the dimensions of standard guide.

In addition to the guide itself, I have fabricated coax to guide transitions
from PC board. Dimensions and pictures of these are on page 37 of the
June 1988 edition of Ham Radio Magazine. This also worked very well,
I got better than a 20 dB match this way.

As Zack Lau indicates, guide is pretty forgiving for most purposes.
The concern about smoothness and precision mostly comes into play when
one is trying for very accurate matches and impedances, or to very
accurately hit a design center without tuning. For amateur use, some
pretty crude homebrew versions work just fine in a lot of situations.

As another poster suggested, lengths of guide seem to be fairly
available at modest price. However, don't be afraid of rolling your
own...

## 139. Re: AM, why handbook shows carrier changing?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-06 00:00:00 UTC
From: netking@dircon.co.uk
Message-ID: <5n9qlr$13a$1@newsserver.dircon.co.uk>
Source record: 93449

>Why don't people believe the words--that the carrier doesn't vary?

Perhaps a major part of the problem is the confusion between the
carrier and the envelope. When you look at a time domain graph
of a modulated carrier you see the amplitude of the envelope varying.
Indeed, the envelope, as the function plotted through the local maxima
of the waveform, does vary. However, the carrier according to the
well known math does not vary. Considering the carrier and sidebands
as signals that are close in frequency, the relative phase slowly
varies between constructive interference and destructive interference.
Thinking about it this way relates a concept that can be grasped
pictorially to a static carrier and sideband(s) and a varying envelope
(this is easier to imagine with only one sideband, i.e. single sideband,
unsuppressed carrier).

What about narrow band FM? That has a constant carrier plus sidebands
(a well known approximation of the math ignores the higher order sidebands,
leaving two sidebands, like AM, but with different phase, and a constant
carrier).
Then the envelope looks to have a constant amplitude but the apparent
frequency changes (e.g. as represented by zero crossing spacing).
Now that is harder to imagine with a constant carrier.

Not true. The power in the carrier decreases as the power in
the sidebands increases, in such a manner that the total *power* remains
constant.

While many advanced 10 gig buffs do not use wave guide
components for construction projects, waveguide components are very
useful for learning theory in class rooms. I now of at least one
company that markets a complete lab kit for education purposes on this
band. There is also quite a few companys that specialice or sell
waveguide components.

Berry,

Since my e-mail I sent to you earlier today I have located two waveguide tubing suppliers. I have not contacted them yet. I will try to do that next week. Their web sites are: www.atwall.com and www.pennengineering.com

My first thought when I started this was to get the tubing and go from there. My first search of the web turned up nothing. That is why I started to look at the possibility of casting. I must have messed up the search. When I tried again I got 97 hits on "rectangular + tubing + waveguide".

If anyone knows anything about these two companies, or any others, please respond.

Mike

>full tilt.

But unless conditions are good, you don't get fult tilt performance. Then
the better properties of the other systems begin to shine even for the
keyboarder. I've had many pleasant Clover contacts under conditions
where those using AMTOR would have given up due to excessive retries.
(And that's saying something because AMTOR isn't that bad under poor
conditions either.)

> Clover requires that the transmitter use AFSK. This prevents, in many
>rigs (poor design in my opinion), the use of the 500Hz filter in receive, which
>is so important to use in these modes, including AMTOR.

Indeed, one needs to be sure that the rig used is suitable. Sometimes you
can *make it so*. For example, the IC-706 has a RTTY mode which allows
use of a 500 Hz filter, but doesn't let you use that filter in SSB mode. However,
there is a way to trick the radio into letting you do that. You tell it in the setup
menu that the filter installed is really the narrow SSB filter, and viola, it
lets you use it in SSB mode (the IF shift has enough range to let you position
it properly). It doesn't know you're lying to it, and you get what you need for
Clover operation.

>I have talked with a (very) few ops who have Clover equipment, and they
>are stuck with AFSK, even in the other modes. This is an operational disadvantage,
>which could be corrected.

Of course the HAL equipment doesn't require you to use AFSK for RTTY,
PACTOR, or AMTOR operation. You can still use them in the normal FSK
fashion. To switch back and forth, you have to enter the setup menus of the
P-38 program and of the radio to get them switched to FSK mode and using
the narrow filter as a RTTY filter again, but that only takes moments. It's
a little bit of a hassle compared to a rig which lets you use the narrow filter

without lying to the radio, but at least it works.

But note that given a narrow receive filter, and a reasonably clean SSB transmitter, there's no operational disadvantage to using AFSK for any of the digital modes. So you don't *have* to switch back and forth to be effective, even though you *can*.

>The cost-effectiveness
>(or lack thereof) of some of the proprietary modes like Clover is very
>questionable if one is primarily
>a ragchewer. Especially with so few stations having Clover equipment.

There are currently over 5,000 stations equipped with Clover capability. That may not seem like a lot, but it is more than the number who applied for, or upgraded, their DXCC status (any mode) last year, and there doesn't seem to be any lack of DX activity on the bands despite that. I'm rarely at a loss for a Clover contact. It is true that PACTOR activity is higher by a rather large margin, but I can do that, or RTTY, or AMTOR too, if necessary. As to cost, the P-38's price has dropped into the range of other multimode controllers.

I do see a second source problem with proprietary modes, but HAL has offered to license the protocol to other amateur manufacturers. I don't think the same is true for GTOR or PACTOR II (though I could be mistaken). And amateurs can homebrew their own units (one off) under fair use. There probably won't be much of that, but it is an option. (Clover can probably be implemented on a sound card equipped Pentium.)

My point is that there is no real disadvantage to having more powerful digital methods available, even if you don' t use them exclusively. And when you do use them, their advanages are quite apparent. Thus I expect a migration toward the newer more powerful techniques and away from the older methods such as AMTOR. I am already seeing evidence of that.

>Now: whats happening in the unpleasant case of arc?

Generally most of the current is in the anode-screen path. But if the
screen is not clamped, or if the tube is exceptionally gassed, the arc
will involve the other elements.

>Now, what potential/current do You see at grid and screen?
>Are these grids robust enough to survive a current of 50A flowing though
>them?

It depends where the arc occurs. Generally tubes are constructed so
the closest point is rather robust, and the arc usually occurs in that
area. For example, if you raise the voltage on a 3-500Z to arc point,
the flash is generally to the grid mounting cone or the upper end of
the grid.

I have no idea where the arc point would be in a 4CX400A, but the
grids are certainly more fragile. If the arc is to a grid wire, the
tube is virtually sure to experience damage.

Remember arcs cause heat, and damage is a function of TIME and HEAT.

By the way, if the arc is gas induced or from a conductive whisker, it
might occur at any point in the tube.

>The plate current is cut off in less than 30ms (milliseconds) in my
>design (or at least it is intended, that it does...)

How?

>potential). The screen is fed (in some designs) from a z-diode
>stabilized power supply with current limit (20mA with the 4CX400).

Zeners are OK, a transistor shunt regulator is better IF properly
designed. Add some extra clamping right at the socket to be safe, and
ALWAYS use a shunt regulator.

>avoid destruction of the screen in case of reverse current (which seems
>to be 'normal' with tetrodes) a shunt resistor (100k to 220k) and
>sometimes a ZNR (surge voltage protector) to ground are used.

That sounds sort of shakey. That resistance is too high, any surge device should be within 50 or 100 vots of rated screen voltage. A shunt regulator is the best idea.

>At a screen potential of 400V a 220k resistor would only limit this
>voltage up to 1.8mA (the 4CX400 has a forward screen current of 20mA,
>any ideas, how big the reverse screen current may be during normal
>operation?

I was told up to 20 mA in that tube, but 15 or less was more normal. You can see how silly the 220k resistor idea is !!!!

>Most designs I have seen only protect the grid with a rather high
>(>200Ohm) series resistor. For normal use, this is not a problem,
>because grid current is very low, but if the tube is arcing, what
>happens with negative bias (which cuts off the tube?

A 2000 ohms series resistor is dumb, if it is between the screen and the shunt regulator. The screen needs firmly clamped and protected by a varistor or other fast acting clamp device AT THE SOCKET.

>Do I have to
>protect the grid to become positive e.g. with a diode shunted to ground?

How would you do that? Or are you talking about the control grid? If the grids normal operating voltage is positive, the only way you can protect it with a diode is by connecting the dodes anode to the screen and the diodes cathode to a STIFF positive voltage slightly higher than the screens voltage. I've done that in 4CX5000's and larger, where other devices would be to expensive. For example, I tied a 4CX5000 grid (1250 volts) through a diode to a tap on an electrolytic string in the screen supply system that was at 1450 volts. But I added a low ESR energy storage cap near the socket (fed from a low value resistor from the 1450 volt supply tap), and put the diode at the socket also.

>Maybe I am to concerned about tube protection in case of an arc, but on
>the other hand I'd be interested about this point.
>Any recommendations for books/appnotes/etc about RF power tubes?

Eimac had some good data in the 60's. All the stuff lately has been less than good, often downplaying good or proper design to make things look easier.

Screen regulation and protection is VERY important, no matter what salesmen seem to like.

If you're in a hurry, Radio Shack sells them for about $3.50. Digikey for
one reliable supplier has them as do several other mail order companies
that I just can't recall right now. Try www.digikey.com if I remember
correctly, you can even download portions of their catalog as pdf
files to be viewed in an Acrobat reader.

AES also used to have them, although whether that was in the catalog
or not, I don't remember. I suspect HRO also has them. Now if only
some of the rarer power and accessory connectors were as easy to
find and get. Oh well! Good luck! I'm also sure that after I send this
off, I'll remember 4 or 5 other companies to get them from.

Pole Climbing Gear FOR SALE

I am no longer in the telecommunications industry,
The following is what I have for sale:

Everything is either new or very low mileage

Bashlin - D21 Climbing Belt
Klein Safety strap
Klein Climbers - complete with spike guards
Klein Safety Orange Tool Bag - Type 5180

All of this for $250.00

I also have:

2 LTC X-500 Coring tools for Trilogy MC2 cable
1 LTC T-500 Coring Tool for P3
These are still in the Box, $35.00 each or
$100.00 for all three

Mid State - SAM 1 Signal Analysis Meter
(Field Strength Meter) In good condition

$300.00

If you are interested, please send Email to:

## 158. MONEY! Lots and Lots and Lots of FREE money!

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-07 00:00:00 UTC
From: Lovey48@the-bridge.NET
Message-ID: <3399E53F.358D@the-bridge.net>
Source record: 93468

DO YOU WANT TO MAKE MONEY FAST!?!?!?!?

The other day, I recieved this email. Now, I am a college student, and I am not at all weathly. So, I decided to give this a whirl... Good luck to you:)

"A little while back, I was reading my junk E-Mail just like you are no, and came across an E-Mail similar to this that said you could make thousands of dollars within weeks with only an initial investment of $5.00! So, I thought, 'Yeah, right, this must be a scam!, like most of us, but I was curious, like most of us, so I kept reading. Anyway, it said that you send $1.00 to each of the 5 names listed in the article. You then place your own name and addresses in the bottom of the list at #5 and send an E-Mail to at least 200 news groups. (There are thousands). No catch, that was it. So, after thinking about it, and talking to a few people first, I thought about trying it. I figured what have I got to lose except 5 stamps and $5.00, right? Like most of us, I was a little skeptical and a little worried about the legal aspects of it all. So, I checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed legal! Then, I invested the measly $5.00... Well, GUESS WHAT! With in 7 days, I started getting money in the mail. I was shocked! I still figured it would end soon, and didn't give it another thought. But, the money just continued coming in. In my first week, I made about $20-$30. By the end of the second week, I had made a total of over $1,000! In the third week, I had over $10,000 and it's still growing! This is now my fourth week, and I have made a total of just over $42,000!!!! And it's still coming in!!! It's certainly worth $5.00 and 5 stamps. I spent more that that on the lottery! Let me tell you how this works and most importantly, WHY IT WORKS. Also, make sure you print a copy of this article now, so you can get the info you need off of it as you need it. The process is very simple and consists of 3 easy steps:

STEP 1: Get 5 separate pieces of paper and write the following on each piece of paper: "PLEASE PUT ME ON YOUR MAILING LIST" Now get 5 $1.00 bills and place ONE inside of EACH of the 5 pieces of paper so the bill will not be seen through the envelope to prevent thievery. Next, place one paper in each of the 5 envelopes and seal them. You should now have 5 sealed envelopes, each with a piece of paper stating the above phrase and a $1.00 bill. What you are doing is creating a service by this. THIS IS PERFECTLY LEGAL! Mail the 5 envelopes to the following addresses:

1. Donald Foulk
216 N. Myers

Bryan, OH 43506

2. Scott Hilterbran
222 W. Pleasant St.
Hillsboro, OH 45133

3. Paul Mewes
5550 Fillmore St.
Merrillville, IN 46410

4. Scott Brkovich
2251 Sandhurst Dr.
Castle Rock, CO 80104

5. Anne E. Ryan
421 E. 32nd St.
Hibbing, MN 55746

Continue to STEP 2.

STEP 2: Now take the number 1 name off of the list that you see above, move the other names up (5 becomes 4, 4 becomes 3, etc...), and add YOUR name and address as number 5 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newssgroups. (I think there are close to 18,000) All you need is 200, but remember, the more you post, the more money you make! Don't know HOW to post in the news groups? Well, do exactly the following:

FOR NETSCAPE USERS:

1) Click on any news group, like normal. Then click on 'To News', which is in the top left corner of the news group page. This will bring up a message box.

2) Fill in the SUBJECT with a flashy title, like the one I used, something to catch the eye!

3) Now go to the message part of the box and retype this letter exactly as it is here, with the exception of your few changes. (Remember to add your name to number 5 and move the rest up)

4) When you're done typing in the WHOLE letter, click on 'FILE' above the send button. Then 'SAVE AS' DO NOT SEND YOUR ARTICLE UNTIL YOU SAVE IT!!!!!!!!! (So you don't have to retype this 200+ times!!:)

5) Now that you have saved the letter, go ahead and send your first cope! (Click the 'SEND' button in the top left corner)

6) This is where you post all 200! Ok, go to ANY news group article and click the 'TO NEWS' button again. Type in your flashy subject in the 'SUBJECT BOX', then go to the message and place your cursor here. Now, click on 'ATTACHMENT' which is right below the 'SUBJECT BOX'.

Click on attach file, then find your letter wherever you saved it. Click once on your file the click 'OPEN' then click 'OK'. If you did this right, you should see your filename in the 'ATTACHMENT BOX' and it will be shaded. NOW POST AWAY!!!!!

IF YOU ARE USING INTERNET EXPLORER:

It's just as easy, holding down the left mouse button, highlight this entire article, then press the 'CTRL' key and 'C' key at the same time to copy this article. Then, print the article for your records to have the names of those you will be sending $1.00 to.

NEXT: Go to the news groups and press 'POST AN ARTICLE', type in your flashy subject and click the large window below. Press 'CTRL' and 'V', and the article will appear in the message window.

BE SURE TO MAKE YOUR ADDRESS CHANGES TO THE 5 NAMES!!! Now, re-highlight the article and re-copy it so you have the changes.... Then, all you have to do for each news group is 'CTRL' and 'V' and press 'POST'. It's that easy! THAT'S IT! All you have to do is jump to different news groups and post away. After you get the hang of it, it will take about 30 seconds for each news group! REMEMBER, THE MORE NEWS GROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE! BUT YOU HAVE TO POST A MINIMUM OF 200!!!!!!!!!!!

That's it! You will begin receiving money from around the world within days! You may eventually want to rent a P.O. Box due to the large amount of mail you receive. If you wish to stay anonymous, you can invent a name to us, as long as the postman will deliver it.

**JUST MAKE SURE ALL OF THE ADDRESSES ARE CORRECT!!!!!!!!!**

Now the WHY part: Out of 200 postings, say I receive only 5 replies (a very low example). So, then I made $5.00 with my name at #5 on the letter. Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #4, and only 5 people respond to each of the orginal 5. That is another $25.00 for me, now those 25 each make 200 minimum posts with my name at #3, and only 5 replies each, I will bring in an additional $626!! Ok, now here is the fun part. Each of those 625 people post a MINIMUM 200 letters with my name at #1, and they each only receive 5 replies, that just make me $3,125!!! With an original investment of only $5.00!!! AMAZING!! And as I said, 5 responses is actually VERY LOW! Average is probable 20-30 letters! So, let's put those figures at just 15 respones per person. Here is what you will make: At #5: $15, at #4: $225, at #3: $3,375, at #2: $50,625, at #1: $759,375!!!!!!
When your name is no longer on the list, you just take the latest posting in the news groups, and send out another $5.00 to names on the list, putting you at #5. And start posting! The thing to remember is, do you realize that thousands of people over the world are joining the internet and reading these articles everyday, JUST LIKE YOU ARE NOW! So can you afford $5.00 and see if it really works? I think so... People

have said, 'What if the plan is played out and happening when there are tons of new honest users and new honest people who are joining the internet and news groups everyday and are willing to give it a try?' Estimates are at 20,000-50,000 new users every day, with thousands of those joining the actual internet. Remember, play FAIRLY AND HONESTLY and this will work. You just have to be honest. Make sure you print this article out RIGHT NOW also. Try to keep a list of everyone that sends you money, and always keep an eye on the news groups to make sure everyone is playing fairly. Remember, HONESTY IS THE BEST POLICY!!! You don't need to cheat the basic idea to make the money! GOOD LUCK to all and please play fairly and reap the huge rewards from this, which is tons of EXTRA CASH.
**BY THE WAY: If you try to deceive people by posting the messages with your name in the list and not sending the money to the rest of the people already on the list, you will NOT get as much. Someone I talked to knew someone who did that, and he only made about $150 and that's after 7 or 8 weeks! Then he sent the 5 $1.00 bills, people added them to their lists, and in 4-5 weeks, he had over $10k. This is the fairest and most honest way I have ever seen to share the wealth of the world without costing anything but our time! You also may want to buy mailing and e-mail lists for future dollars. PLEASE REMEMBER TO DECLARE YOUR EXTRA INCOME!!!!!!**"

## 159. Please help - valve bases

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-07 00:00:00 UTC
From: Harry Lythall <acz732k@tninet.se>

Hi all,

I am trying to get hold of Qty 10 valve (tube) bases
type B9D, sometines known as 'Magnoval'. Does anyone
have any spare that I could buy or do you know of a
retail outlet that may have them?

These bases are 9-pin, but are NOT the same as are used
for 12AT7 or similar valves, they are a little bigger.
The bases are used for the PL500, PL509 and PL519 tubes.

Many thanks for taking the time to read this.

73s de Harry (SM0VPO)

PS my homepage is well worth a visit:

Antique Electronic Supply in Tempe, AZ offers them for sale in their
catalog for under $3.00 ea. They have both the small pins for such as
6JE6 and the larger such as PL-509's. (602) 820-5411

Hi,

Anybody know the number and availability of a good prescaler I.C. for an old freq counter? This counter only goes to 30 MHz and I would like to extend it to 300 MHz.

Thanks,

Bob

## 165. plans for simple 6 meter amp

Source record: 93476

Hi all.

If some of you missed the CB2SIX article recently, it can now be found at my homepage, at the following url:
http://home.sol.no/anderskv/files/ham/mods/cb2six/

There you can find all the 10 (11) parts stored separately as text files, and also all of them zipped together into CB2SIX.ZIP.

If you are having problems downloading from my that url, please let me know, by sending me a personal email, since I am not visiting the newsgroups to often.

If you have questions regarding the modification itself, I am sorry but I CAN NOT HELP YOU.
I have not tried to perform it, and it is not written by me either. I only received it via packet radio some time ago, and thought it migth be of interest to others.

PHOTO PHOENIX INTERNATIONAL

We are an international New York based agency representing
amateur and professional photographers in the following areas: Galleries,
Business and Organizations, Book Publishers, Paper Products, Consumer
Publication, Newspapers & Newsletters Publication, Special Interest Publication,
and Trade Publication.
We are seeking photographers who strive for excellence in the aesthetic/
creative and technological world of images, who have the talent to capture
the setting and to convey the mood. Your work should reflect a genuine,
pervasive interest in photography as a fine art.
Whether your work portrays conservative, experimental, stylish, or innovative
themes, your project proposal should be well thought out before submitting to
us.
For first contact, please submit a query letter, direct mail flier/brochure,
tearsheets, slides, photographs & SASE.
For amateur photographers, send sample photos and/or slides.
TO ALL: Do not send entire portfolio unless we ask for it. If we are not interested,
you might not hear from us, so please submit material that does not need to be
returned.

Send to:
Photo Phoenix International
33-29 58 Street
Woodside, New York 11377

>Now that is harder to imagine with a constant carrier.

Actually, FM doesn't have a constant amplitude carrier. In fact the carrier disappears completely at the Bessel nulls. That's a standard way to determine deviation. What is constant in FM is the *sum* of the carrier and the sidebands.

So, AM has a constant carrier, but amplitude of the total signal varies with the vector sum of the carrier and the sidebands, but FM has a carrier which varies with modulation, but total signal amplitude is constant because, as sideband power increases, carrier power decreases, and vice versa.

## 172. AADE filter design update

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-08 00:00:00 UTC
From: Neil Heckt <neil@aade.com>
Message-ID: <339B0115.6BD8@aade.com>
Source record: 93482

A customer found a bug in Version 1.4. UTILITIES | ENTER DESIGN allows you to enter the schematic and parts list of a filter from a book or magazine for analysis. The program normally saves design specifications for those filters which it designed and uses them to set defaults for analysis. In the case of ENTER DESIGN it does not know the design specifications and saved a bad piece of data. Trying to LOAD the filter caused a runtime error 13 and the program aborts.

Version 1.6 fixes the problem by storing dummy values for design parameters thus producing dummy default analysis parameters that usually work as a firts analysis attempt.

To update to version 1.6, go to my web page and follow the thread to the download page. Download filter.zip, unzip it and replace the filter.exe program where ever you installed it.

## 174. R and S URE help wanted

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-08 00:00:00 UTC
From: Susan Shapiro <rae4@popd.ix.netcom.com>
Message-ID: <339B2201.22D0@popd.ix.netcom.com>
Source record: 93484
Cross-posted to: sci.electronics.equipment,rec.radio.swap,rec.radio.amateur.homebrew

I have a Rohde and Schwartz URE rms voltmeter that needs some tlc.
It consistently comes up with an "error 8" message, which I presume is
something to do with the auto-calibration routine... I do not wish to
cough up the $250 the Tektronix, the US agents, are demanding for the
manual, which is several hundred percent more than the thing cost me!
(Ah, those swap-meet bargains!) If there is anyone out there that could
help either with the loan of a manual, or the way to get rid of the
message, I would be grateful, obviously would be glad to pay reasonable
expenses for copying etc.,
Thanks for taking the time to read this.
Dan AC6AO rae4@ix.netcom.com

Narrow band FM does have constant carrier, in approximation, and in the
limiting case as modulation index tends to zero. As the
modulation index increases the Bessel function describing the carrier comes
down and eventually disappears as you say. Except for the Bessel zeroes,
any FM with a constant frequency modulation and constant modulation index
has a constant carrier level (which may differ from AM with the same
unmodulated carrier level).

Source record: 93487

For anyone wishing to use suface mounted type components of any type can be very difficul unless a specific printed circuit board (PCB) is made. There is now available a PCB that will allow most surface mounted and through hole components to be connected via wires to each other. The PCB can be easily be expanded. For further information please contact me.

Hi and thanks in advance for your help,

I trying to repair an RCA 19" TV. The symptoms are that it is
"Deader thank a doorknob". It was on and all of a sudden it went dead.

The power is making it up the cord and through the fuse. The next thing i
would normally check is the on/off switch. The switch itself seems OK,
but the set also is able to be switched on and off by remote control, so
its possible that this is the problem. However, I'm open for any ideas.

Thanks again for any help you can offer

Jerry, I've had mine for 2 months now, love it but I'm having problems finding a power supply other than a battery that won't cause problems. (unit is 5w mod) My HB regulated PS (mc1463 + 2n3055) introduces some MCW (buzz) I put a big filter cap (4700 uF) after it and the buzz went away but a chirp developed. I've tried puting an RF choke in the battery leads but made things worse. What seems to work? Unregulated supply maybe?

Peter Dahl.

Or rewind your own. It's pretty simple. Instructions are
(or used to be) in the ARRL Handbook.

Or get a surplus 6V and a variac. This, along with a volt meter
at the filament pins, is the best method if space and weight
are not considerations.

so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
June 15th, 1997
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >1000 cars!

Buyers admission is $4 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Seperate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

>Any help appreciated.
>
> Adam, KB8YDX

The question is, which test point? The phases towards the end check out the T/R switching (again) as well as setting the bias for the output stage. A back issue of _Hambrew_ magazine had an article which described one builders experiences, and he mentioned that Ten Tec tech support told him to ignore the current reading bias set technique in the instruction manual (get an increase of 400mA from idle) and just set the pot so that the emitters of the output transistors are at 0.75VDC. I found the whole output bias adjustment recommendation to be poorly conceived, but when set using the (thrid-hand) recommendations from Ten Tec technical support, things worked out well.

good luck!

Those are enormous provisos, Colin, and tend to obscure the point. It is true, without reservation, that the carrier level during modulation and the un modulated carrier level are different for both the Narrow-band and wide-band FM signals. It is also true, in the NBFM case, that the carrier level reduction will be small at small modulation indices--but it won't be zero and the carrier won't be constant unless the consistency of the input signal remains.

## 195. Drake TR7 1mixer problems?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-09 00:00:00 UTC
From: chalpm@hqlab.ico.olivetti.COM
Message-ID: <199706090927.CAA20139@noc.ucsd.edu>
Source record: 93496

On the first mixer (DBM) LO port of my R7 Drake 1.05 Veff is present.
I think that this doubly balanced mixer is 7 dBm and I believe this
driving voltage in excess.
This LO power can create the malfunctioning (noise, intermodulation
other)???????

Thanks in advance

73 de IW1DZD e-mail: chalpm@hqlab.ico.olivetti.com

## 196. Want: Signal Tracer schematic

Newsgroup: rec.radio.amateur.homebrew

## 197. Scanner Parts needed

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-09 00:00:00 UTC
From: ej.mars@lagn.com
Message-ID: <46431553@lagn.com>
Source record: 93498

Hi
I am looking for the following:

1) Pro 2003 Scanner: IC Chip (GRE-141) or Substitute.
2) Bearcat 210XL: IC Chip (SK-7731) or Substitute.
3) Need a complete non work (Bearcat 300) for parts. The Case and face plate with the Led's must be in good condition.

Please respond to ej.mars@lagn.com if you have or know where the above can be purchased.

Thanks

## 198. Q: How to open a Yaesu FNB-4A battery?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-09 00:00:00 UTC
From: burch@sps.mot.com
Message-ID: <5ngv2v$8c4$3@newsgate.sps.mot.com>

Hello,

Does anyone know what needs to be done to PA grid of 4cx250b after removal of the driver tube? I am interested in operating this amp on 2m SSB, but perhaps 432 also. This amp has a 6816 driver which seems to share the LC tuned circuit between the driver plate and PA grid.

Any other required mods. also would be of help.

Any help appreciated.

tnx,
ED WA3DRC

It is a pain in the butt mostly, but can be done with a thin, sharp edge to pry open the edges. I just saw, I think on this group, someone suggesting you stick the battery in the freezer and then bring it out frozen and smack it on a surface to break the glue that Yaesu uses to prevent us from reusing the case (silly Yaesu, they even put it over the batteries sometimes making it very difficult for us with no benefit that I can see....). Check the archives of this list.

I just pry them open, but it can take a half hour or more to do it neatly.

: >disappears completely at the Bessel nulls. That's a standard way to determine
: >deviation. What is constant in FM is the *sum* of the carrier and the
: >sidebands.
: Narrow band FM does have constant carrier, in approximation, and in the
: limiting case as modulation index tends to zero. As the
: modulation index increases the Bessel function describing the carrier comes
: down and eventually disappears as you say.

(seems OK...then this:)

: Except for the Bessel zeroes,
: any FM with a constant frequency modulation and constant modulation index
: has a constant carrier level (which may differ from AM with the same
: unmodulated carrier level).

This leads to the absurdity that the carrier very abruptly and suddenly
disappears when the zero-order Bessel function reaches its zero...and is
inconsistent with the preceeding sentence. It's a smooth function.

## 210. 2n4416 vs 2n2222

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-10 00:00:00 UTC
From: Trapper27@juno.com
Message-ID: <339cc0ba.1820214@nntp.infoave.com>
Source record: 93320

I am building a regenerative reciever from W1FB's Design Notebook....
it call for a 2n4416 transistor which I have not been able to locate.
I do have several 2n2222's laying around though.... does anyone know
if the values of these two transistors are close enough to substitute?

I would do the try it and see what happens smoke test but this is my
first project.... and have spent a good bit of time etching and
placing parts to go blowing something up!

Also if anyone has W1FB's Design Notebook.... the schematic is on
page 109..... and according to the schematic I can not identify
exactly how to connect my feed line. I have 133' dipole 40ft above
ground with 300 ohm ladder line for my feed.... The schematic shows
only one connection on "L1" which of course would go to one of the
side of the ladder line..... does the other side of the feed line go
to any specific point on the PCB or will any portion of the the
grounded areas of the board work.

Thanks in advance to all who respond,

KF4HTL
Marty Hawkins ..... Upstate South Carolina
soon to be a homebrewer!!! If I don't get electricuted 1st :)

Wasn't the first unit listed an Exec I (not the Exec II) that used
tubes for the driver and final (rest of the radio is solid state)? I
used to have RG56TAS66 models on high band that were Exec I units
(from the mid to late 60s I think).

>KA8DDZ - hynde@flash.net
>Equipment NorCal 40A, NorCal 38 Special, Dipoles

That's a GREAT idea !! You can start over here. First, go to the Philippines and get all the slims off 40 meters (look up NPA in the dictionary before you go, and bring your 38 special, you'll need it). Then, you can rent a boat and clean up the high seas in Asia, take the radios away from all the Korean fishing boats (loads of 2 meter rigs) on your way to Indonesia, where you won't have any problem finding pirates at all. On the way home, drop by China and get all the 20 meter radios that are being used as part of the new national HF telephone system, then make a quick stop in Hong Kong and take all the 25-30mhz FM rigs away from the cab drivers. You should get enuff radios to fill a couple 40 containers. And don't forget to order your Radio Police Badge from QST before you leave home, so nobody will complain or question you when you take thier radios away.

But I think, maybe, the guy who wrote the original message was speaking of AM pirate BROADCAST stations, and I'm not sure many high school students would be interested in AM rigs because most of them don't have 2 VFO's, 200 memory channels, and built in antenna tuners.....

Message-ID: <339d31d6.6745998@news.erols.com>
Source record: 93326

Homebrewers:

I'm thinking about building the "Bare Bones Superhet" Receiver
featured in the June '82 issue of QST.

I'm looking at the parts list and wanted to consult with the group re
parts availability.

Plan calls for use of coils wound on bobbins of an Amidon L-57-1
transformer assembly. Will I be able to find one of these? Where?

The filter is made from three Radio Shack Color burst crystals. Does
RS still sell these?

Has anyone out there built this receiver? Looks like a neat project.
I want to pair it up with my W1VD 6 Watt TX.

Marty,

You can't use a 2N2222 to sub for a 2N4416. The 2222 is a bi-polar xstor
and the 4416 is an FET. You might try using an MPF-102. It is reasonably
close to the 4416 and you can find them at Radio Shack.

You still need a shunt regulator for SSB if you want good IMD
perfromance. With a shunt regulator you don't need a bleeder, but the
screen supply voltage has to be twice the screen operating voltage to
limit screen dissipation in the case of abnormal conditions.

>I was talking about the control grid. For the 4CX400 the control grid
>voltage is -38V for normal operation and down to -60V to cut it off.
>I just thought, that a series resistor to the grid supply would make the
>control grid voltage to rise toward zero or even positive, which fully
>turns on the tube.

It's a good idea to keep the control grid supply impedance low, that
way if you accidentally run a little grid current the bias won't shoot
up and cause severe distortion.

Grid drive should be monitored with a hold-type peak detecting
indicator that warns you when control grid voltage starts to exceed
allowable values.

This 50 ohms grid resistor non-sense that's been published lately is a
bad idea. Use an L pad or catode drive the tube. Design the PA so
your exciter is nearly at full rated drive, it will have the best IMD
performance then.

This is correct. Motorola used to make the TO-18 metal can 2N4416 long ago, but have dropped it from their data book. You can however still get them from various surplus dealers. Dan's Small Parts has them for $1.50 each. http://www.fix.net/dans.html Also, "Tanner Electronics", Carrollton, TX has a few for about $1.00 ea. (972) 242-8702, ,takes charge cards.

## 221. Ocean Tech Company Looking For Technician

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-10 00:00:00 UTC
From: Andrew Goldstein <aeg@desertstar.com>
Message-ID: <01bc75b8$2fbbcb80$a267e3a5@howl.com>
Source record: 93331

Dear Reader:

We are a small ocean technology start-up company. Demands for our products Is growing fast, and so we are looking for an electronics / mechanical technician to assist in our production department. The right person is interested in ocean technology and likes working with electronics. You should have skills in reading schematics, operating electronic test equipment and soldering. Maybe you can even design simple circuits. It doesn't matter if you acquired those skills in college or you tought yourself. Recent high-school graduates are certainly accepted.

Our products are underwater navigation and communication systems which are used by robots as well as commercial, scientific and sport divers (check out our web page at http://www.desertstar.com). Your job will be to assemble and test these systems. You must be a reliable and honest worker. As a member of a small, dedicated team, you are fully expected to pull your load. Our customers rely on our equipment in remote corners of the world. It must be reliable. Therefore, we demand attention to detail and the ability to do quality work. We need a person who is interested in getting the job done - putting in long hours should not be a problem.

The job comes with the challenges, risks and opportunities of working for a high-tech startup. While this is an entry level position, you can advance as fast and in whatever direction your talents allow. A lack of 'seniority' won't hurt you, nor will gaining seniority by itself help you. In our company, everyone wears many hats. So you won't be doing just production work, but you'll also be answering the phone, taking orders, answering customer's questions, helping in ocean tests, etc. Initial wages are moderate. Pay will rise as your skills and performance improve.

Benefits:
This is a job for a person who regards working in the ocean field, working on many projects and learning a lot of new skills as a major benefit. We also offer the benefits of a hi-tech start-up: Annual bonus checks that reflect the companies and your performance. Stock options are a possibility if you prove yourself to be an excellent performer.

Our Location:
Desert Star Systems is located at California's central coast, just a few miles north of Monterey. The terrain topside is as spectacular as it is below the water. Unlike the San Francisco area to the north and LA to the south, Monterey County is uncrowded. The weather is usually sunny, though foggy days are common in summer. The diving is great, and it's not far to the mountains or the desert. Our office is located on a former military airport and you can learn flying ultralights or sky diving here. There are several good colleges in the area too.

If you are interested:
Please send an e-mail to Marco Flagg (mflagg@desertstar.com). It helps if you tell us a bit about yourself, why in the world you'd want to get a crazy job like this one, and what your skills and experience are. We are looking forward to hearing from you!

From: Nathan Gordon <nathang@bigfoot.com>
Message-ID: <01bc75cc$06a53600$dff489cc@Sheaffer.mcs.net>
Source record: 93333

Hello All,

I have built several kits, receivers, etc. Presently I am working on finishing a 2 meter kit from Ten Tec. I am wondering if anyone here has any suggestions for a completely home-brew project? I would like to build an HF CW transceiver from scratch. No circuit board, parts packages, etc. Does anyone have any suggestions on a first project??

Thanks,
73, de KF9LI

Well, duh. When modulation is zero, there is nothing to cause the carrier to vary. That's a given. With *any* modulation, however, the FM carrier does vary in amplitude. The variation peaks at certain modulation indexes according to the Bessel function. Of course modulation index is a function of both the deviation and the modulating frequency. Even with low deviations, there are modulating frequencies which will yield an index which forms a Bessel zero. In other words, with a voice bandwidth of 30-3,000 Hz and a 3 kHz deviation, the modulation index varies from 100 to 1. That allows a number of Bessel zeros.

Marty - It won't work - 2N4416 are single gate FETs, while the 2N2222 is a bipolar NPN transistor - completely different. However, my experience is that almost any small signal FET should work in place of the one specified. Try 2N3819, MPF102, 2N5459, 2N5485, 2N5486 or MPF105 for starters.

I'm not familiar with the receiver circuit, but my own experiences with a similar receiver (FET RF amp, FET detector, LM386 audio) has been good. The secret is to build it like a battleship - metal case and all. Also, use vernier reduction drives if you can get them.

Though I've never tried it, I've heard of people curing hum by wiring a
disc ceramic capacitor across each rectifier in the power supply. As I
recal, a value of 0.01-0.1uF was called for.

John,

These things definately have tube finals, but the club has lots of
spares and they aren't interested in replacing the rigs at this time.

The stamps on one of the boards shows a "built" date of Dec, '72, so
you're in the right ballpark.

If you happen to have any of that old literature laying around, it would
be greatly appreciated.

Thanks again,

Ron, N7TAW

The pulic gets what the public wants, in short parents don't want the
responcibility of helping to educate thier children, they want to work
at a job, get paid and leave the rest to the bloody school system 'cause
it's easier. The result is what we now have, educational stupidity at
many levels and an amazing lack of public support for our schools. Such
is the situation in California.

Has anyone tried to homebrew their own Van Eck test unit? Does anyone know of a good place for kits/plans to experiment with this?

So far Codex has info on it but it is a little more than I can afford starting at about 5k.

Any info like books or articles would be of interest. I have found a few items on the theory and warnings that it can be done but nothing to actually experiment with.

Nathan sounds like your one or two up on me.... I am building my
very first receiver. It is a regenerative receiver. No kits.... just
a schematic out of a book. I have plenty of schematics for QRP gear.

I just ordered a scanner... and it should arrive at the end of the
week... so if your not in a big hurry.... I could e-mail you some
gifs of schematics for QRP tracievers, after I get the scanner up and
running.
I can also get you phone numbers for MOUSER and NEWARK
ELECTRONICS.... I mail order componets from them and they are much
cheaper than any radio shack.... and shipping is cheap too! Also
there is Dan's Small Parts on the WEB and he caters to homebrewers!
I also have a recent AMIDON catalog with all sorts of coil forms.

I might not be much for knowing what I am doing when I solder.... but
I have been collecting the right resources to have around when I do
start to understand! :)

Just E-mail me at TRAPPER27@JUNO.COM

Source record: 93354

I'm looking for some (2+) miniature lightbulbs for an accurate (10microwatt), widerange(HF-500MHz), lowcost wattmeter project described in an old magazine. It uses two miniature (T3/4 size) tungsten lightbulbs each at 5V drawing .02A (giving +-0.1W output) as bolometers. It lists the manuafacturer as Chicago Miniature but I can find no trace of them on the web, the article dates from early '70s. If anyone could help me I'd be very thankful. TIA

## 247. How do I connect HTX 202 to a MFJ 1278 TNC

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-11 00:00:00 UTC
From: begg@metraplex.com
Message-ID: <5nma9k$f32$1@news2.digex.net>
Source record: 93357

I need help in connecting an HTX 202 to a MFJ 1278 TNC.
The TNC has the following leads coming out:

GND
SPEAKER
MIC
PTT

How do I connect the PTT into the HTX Mic Jack along with the audio?

Any help would be appreciated. Thanks, Allan Begg ( begg@metraplex.com )
Please e-mail response directly.

>PL unit ? Even an explanation on how it works might due?

If you can get your hands on the May 1997 issue of _RF Design_
magazine, on page 56 there is a tutorial on PLL system design, which
assumes some knowledge of PLL basics. An excellent treatment of PLL
design can be found in Motorola application notes AN535, AN827, and
AN1207. AN535 contains a very good introduction. These can probably
be gotten from Motorola via their web page.

## 249. Heath replacement parts????

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-11 00:00:00 UTC
From: Todd <tboyer@erols.com>
Message-ID: <339EBBD9.3D83@erols.com>
Source record: 93359

Thanks for reading this post.

I have a HEATH SB-104A. I snapped it on the other day, just for GP, and noted no power to the radio. After some investigation I found that I have blown a power transistor Part(417-162) or MHT-9210. I have been unable to find a replacement for this part locally. Does anybody know of a source or suitable replacement? There are a pair of these mounted on the main chassis.

thanx for any help

todd

IMMEDIATE Openings for Controls Engineers and an AUTOCAD Professional

Martin Automatic, Inc., is a machine tool OEM with excellent benefits and competitive salary. We employ over 250 people, have been in business over 30 years, and do business internationally. We have an informal and cooperative work place atmosphere.

Machine controls design to customer specs. Vector, servo drives from various mfgs.; PLCs from various mfgs.; dedicated controllers of our own mfg.; pneumatics; etc. If you like to be exposed to a variety of challenges, this is the place for you!

My departments consist of: Electrical Engineering; Lab (R&D, assembly, electronics repair); Electrical Panel Assembly; Network&Internal Data Systems; Programming (dedicated micro-controllers and company IS systems). I am always interested to speak with bright, capable people that can contribute to Martin Automatic's future.

If you have any questions or would like to schedule an interview, please feel free to contact me, 815-654-4800 or emilgborys@worldnet.att.com. I conduct interviews myself, not through a personnel dept., and I will notify you of the results promptly and in person.

Use the wiring diagram for the IC-2A ( or just about any other "leaky PTT"
HT, actually. ) You may need to change the value of the resistor to get it
to key correctly.

Hi Nathan OM,

I strongly suggest getting a copy of QRP CLASSICS from ARRL. In there
you will find a wealth of information
on simple TX and RX. Also, "Solid State Design for the Radio Amateur"
is an excellent resource, and much of it
is timeless too. Do not assume that one-off projects need PC boards. I
use ugly construction. You are going
to want to make modifications as you go along, and PC board layouts do
not lend themselves well to this, plus
they require parts that are the right size and shape as the original
design. Too constraining.

73 and GL,
Don, W6JL

Chicago Miniature is a major manufacturer of indicator lamps. Their products
are carried by most major distributors in the US. Try Newark Electronics. Note
that there are Far East copies of most of their line available at lower cost. Again,
most major distributors will have them.

Does anyone know where I can get the manuals mainly for this unit. I was given this from a friend, and it doesn't have a mike, key, or anything. Just a xceiver unit and a very large amplifier unit. Before playing with it, I need to see how to wire up a mike to it. If anyone can help obtain a source for the user/service manuals on this unit I would greatly appreciate it.

Thanks.

Sylvania/GTE list a T-3/4 bulb 5.0 volt .021 amp with wire terminals. the part number is 2AS15. Chicago Miniature list 5.0 volt at .06 amp #6833 and 5.0 volt at .0115 amp #7153 The Chicago minis are listed in Newark catalog. Not the Sylvania though. The cost per lamp is $12 to $16. OUCH!

Nathan-

Tube stuff.

Big parts you can see and not worry about overheating with the soldering
torch.

Regen receivers.
One tube transmitters.

You'll be amazed at how well this old stuff works.

1) Check Brians web site http://www.mnsinc.com/bry/hamfiles.htm
he has links to other tube based stuff too.

2) Check glowbugs mailing list. Send mail to majordomo@www.atl.org with
help
as the only thing in the message body. You will receive instructions.

## 261. Homebrew on packet

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-11 00:00:00 UTC
From: Harry Lythall <acz732k@tninet.se>
Message-ID: <5nn35c$3ah$1@pommac.tninet.se>
Source record: 93371

QRP project files may be accessed automatically from G0TLA's QRP 'PMS' on Packet radio. Ron has religiously maintained a directory of QRP circuits + antenna projects. The following procedure describes how you access the information on Packet Radio. Access requies NO human intervention, guaranteeing an instant response from Rons server. The text beginning with > is a packet command & assumes that you are connected to your local BBS.

---

To request a DIRECTORY LIST use the "SP REQDIR" command:-

> SP REQDIR@G0TLA.GB7NND.#23.GBR.EU
> QRP@*****
> /EX (or ctrl-Z)

Sends a DIR listing of \QRP directory. ***** is your own BBS.

---

To request a 7PLUS ENCODED FILE use the "SP 7PSERV" command:-

> SP 7PSERV@G0TLA.GB7NND.#23.GBR.EU
> QRP\SWR-PWR\SWR-PWR.GIF@******
> /EX (or ctrl-Z)

Sends a 7PLUS encoded file of "SWR-PWR.GIF". All files in a project are
contained a single PKZIP, which may be accessed by using the "SP 7PSERV" command. ****** is your own BBS.

---

To request a TXT FILE with the "SP REQFIL" command:-

> SP REQFIL@G0TLA.GB7NND.#23.GBR.EU
> QRP\SWR-PWR\SWR-PWR.TXT@SK5BKI
> /EX (or ctrl-Z)

Sends the file "SWR-PWR.TXT". REQFIL may ONLY be used for TXT files. ****** is your own BBS.

---

Note that Wildcards ("*" etc.) are NOT allowed.

I think Ron deserves praise for his voluntary efforts, so if you do use his PMS then I am sure he would appreciate the odd message of thanks. His packet address is

"G0TLA@G0TLA.GB7NND.#23.GBR.EU"

---

Projects and files available at the time of writing this page are listed below - note the directory structure. If you do

request a download the ZIP file you will get ALL the TXT and
GIF files for that project. Projects usually have the same
name as the directory

e.g. 1TUBETX.ZIP is found in the directory \ file:

C:\QRP\1TUBETX\1TUBETX.ZIP

It is worth requesting a 'REQDIR' listing of his QRP\ANTENNA
directory as many active constructors have submitted antenna
for Ron to put on his PMS.
---

QRO\SPARKY - Spark-gap transmitter. Fun from INTERNET 3 files
QRP\160RXMOD - Convert cheap AM radio - 160m. SSB/CW. 4 files
QRP\1TUBETX - Single valve TX (battery valve egDL91). 3 files
QRP\250MWTX - 250mW HF TX with 3W PA stage, for 7MHz. 4 files
QRP\2TUBETX - 7 watt TX using most 6.3/250v Pentodes. 3 files
QRP\317-TX - Experiment. Use voltage regulator as TX. 3 files
QRP\5W-TX1 - Low component CW TX. Uses: 1xNPN+1x7400. 3 files

Better, in that their specifications are tighter. (For example, the 2N4416 IDSS is specified as 5-15 mA, a 3:1 range. The MPF102 is 2-20 mA, or 10:1.) I wouldn't be surprised if 2N4416's are selected from the same dice MPF102's come from.

## 267. Neon lamp 180 meter QRP Xmitter?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-11 00:00:00 UTC
From: Matthew Kleinmann <matthew@bigdog.geo.cornell.edu>
Message-ID: <339F0B2E.3F54BC7E@bigdog.geo.cornell.edu>
Source record: 93377

I should just try this but on the off chance that someone already has..
Can you get a neon lamp relaxation oscilator to run between 1.8 and 2
Mhz? If you cover the lamp and keep it away from your hand and body,
how stable is it? That picture of the little QRP transmitter in the
ARRL handbook based on a TTL gate has gotten me thinking....

Hi Tom
Why is it non-sense to use a 50 ohm resistor in the grid circuit?
Mark
ps: I am looking for a simple method of driving a 4cx800.

## 269. Help identifying GE preamp transistor

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-12 00:00:00 UTC
From: gkd@bigwpi.WPI.EDU
Message-ID: <5nq27l$mav$1@bigwpi.WPI.EDU>
Source record: 93257

I have a GE VHF helical reasonator preamplifier salvaged from an old mobile 2-way radio which I'm trying to find a replacement amplifying transistor for. It appears to be late 60s vintage; is a rectangular copper housing about 5" X 1.25" X 1.5" with the number PL19C300428G2 stamped on the side. There are three helical reasonators on the input and a trimmer on the output circuit.

The blown transistor is a PNP with a 4th lead attached to the case, and contains the following markings: Philco 300037-4 1J3 6250. It plugs into a socket through a small hole in the unit's housing. If anyone is familiar with this device and can suggest a suitable replacement transisistor, I'd like to try to get it working.

I guess I got duped on this one... I thought they were UNLOADING
equipment.

Price and reliablity wins eh? Are you going to buy from halfway across
the nation to save a few dollars? Better find a GOOD radio dealer in
your area that supports their lines of equipment with service and parts
before you start taking bids from all over the country. Your loacal
repair/dealer wont do you any favors when he finds you bought from out
of state to save $10!

Source record: 93263

I am having trouble locating the molex plug (power supply side) that plugs into most modern HF transceivers such as the IC-738, Kenwood, ect....

The molex connector has 6 pins.
On the top row of the molex connector the middle terminal is keyed---flat side facing up.
On the bottom row of the molex connector the two end terminals are keyed---flat side facing out.

I have searched and searched but cannot find a good part number nor source of supply.
I refuse to pay 29.95 for a pre-fab power cable with the connector attached (ICOM Price).

Hopefully, some of you folks have had the same problems and can provide an answer for all.

Thanks.

Source record: 93381

Hi:
I am thinking of building a very high voltage
split stator capacitor for my loop antenna.
My 5kV vacum cap probably won't work safely
above 100W on my magnetic loop antenna.
The ARRL handbook mentions required voltage
ratings aroudn 30 kV. Has anyone been
successful at homebrewing a high voltage
split stator capacitor for a magnetic loop antenna ?
I know I can look up the dielectric strengths of
air, and other insulator material, but does anyone
have any real experience with the unseen
problems of working with high voltages.
I don't know what sort of shape to cut the
capacitor plate, to make the tuning linear, and
or to reduce the chances corona discharge, etc.
P

Yes, a RCA CA3179.
It is a divide by 64 or 256 and is good up to 1.25ghz although I have
got it the read 2.1ghz at .5mw into a Heathkit 2410 counter.

Hi Peter,

The problem is that you will need a quite large gap between the plates
in order to get a voltage rating of 30kV. As the capacity decresases
when the gap becomes larger, you would need more and/or larger plates
so the whole capacitor would be _large_. I think, a better idea is to get
a vacuum capacitor which a higer voltage rating. 5kV is the lowest rating
available from Jennings, and they make capacitors for up to 65kV or so.

By the way, 30kV sounds very much... perhaps you can try and increase
the size of you loop. lambda/3 is the maximum value possible as larger
loops become self-resonant due to the loop's stray and distributed
capacity. Increasing the loop is also advantageous as this increases
the antenna's radiation resistance, too (which is quite low in for
small tuned loops). And, according to theory, the voltage is lower when
you have a large loop and a small capacitance.

I'm experimenting with 33cm (902-928 MHz) in hopes of putting up a voice repeater in the near future. I've been looking at what is commerically available (e.g. the Comet FP-19 or various Decibel Products Commercial antennas) and wanted to know if anyone had any good suggestions on constructing my own antenna.

Also, is constructing a 33cm duplexer feasible? I've worked with one ham who makes his own 70cm duplexers with good results.

Dave,
You should know the laws of physics never stand still,
Tesla told us that.
I'll also agree to dissagree with Jerry.
Recently myself and several other here in the UK have experienced some
unusual propagation on 160m, only experienced during daytime and with
two or more high powered stations (we operate full legal mobile) whereby
there is deffinately something up with our 'D' layer. There are short
bursts of very stong signals received at both ends of a two way, similar
to MS. The normal micky mouse op's hear this phenomenon but don't
experience it. Global warming???
Answers please on a postcard...

PS. I'll tell my friend up there in the windy city to auction off his
mobile cos you said it was'nt worth it.
I know what his answer will be.

> You still need a shunt regulator for SSB if you want good IMD
> perfromance.

IMO, a screen shunt-regulator has nothing to do with IMD, but it has
everything to do with the preventing destruction of the tube . Shunt
regulation is one of the two means of preventing potentially-fatal screen V
runaway due to reverse screen I.

>With a shunt regulator you don't need a bleeder, but the
> screen supply voltage has to be twice the screen operating voltage to
> limit screen dissipation in the case of abnormal conditions.

True enough. More R would be better. The most logical source is the
positive HV supply, which is typically about six times the screen v.

> >I was talking about the control grid. For the 4CX400 the control grid

> up and cause severe distortion.

Does it make sense that::
-1-. 'a little grid current' would 'shoot up' the bias V, cause a large
decrease in ZSAC, resulting in 'severe distortion'?
-2-. after adjusting an AB1 amplifier's grid bias V to prevent Zero grid
current, that the operator would decrease the grid bias V to cause grid
current?

I use a Class AB1 8169 amplifier. If I mis-adjust the bias V to a lower
amount, as the grid is over-driven, the DC grid V and DC grid current begin

to increase. However, as the DC grid V increases, grid I decreases, so the process is self-limiting and the sky does not fall, afterall.
>
.....snip.....
> This 50 ohms grid resistor non-sense that's been published lately is a
> bad idea. Use an L pad or catode drive the tube. ...snip...

Agreed--especially if an inductor is connect in series. I have also seen a published recommendation that a cathode RF negative feedback resistance (Rk) be used. Another solution is to use a broadband, bifilar step-down toroidal transformer and a 12.5 ohm grid terminating R. This is a more satisfactory solution than using large values of Rk to consume overdrive volts. To explain: Screen-to-cathode voltage has an exponential influence on peak emission. Let's say that the grid bias V is 50v and that the exciter produces 100 peak volts (100w-pep into 50 ohms). To prevent grid current, 50 peak v would have to be consumed across Rk. However, this 50v drop will also subtract 50v from the screen to cathode potential--which will simultaneously cause a (Esc1/Esc2)^3/2 decrease in peak cathode emission--which will offset the IMD benefit of RF-NFB.
- A possible workaround to this problem is the (untested) circuit shown in Figure 10 in *Amplifiers* at:
http://www.vcnet.com/measures
If the circuit works as I designed it, any voltage drop across Rk can not subtract from the screen to cathode potential.

Hi Peter,

30KV in air will require a plate spacing of about 1.2 inches (at 25 KV/inch)! You can easily calculate the plate area required from formulas in the ARRL handbook (at least the older versions; the newer ones may have been dumbed-down and some material deleted). It WILL be a big capacitor. I suggest you instead make the loop larger, as the radiation resistance will increase, Q will decrease, and consequently the voltage on the capacitor will also decrease.
Loops can be made up to 1/3 wavelength in circumfrence before becoming self-resonant (tuning capacitance = 0). See ARRL Antenna Book or Handbook for loop design equations.

GL and 73,
Don, W6JL

WINDTRAX BALLOON LAUNCH!!!

WindTrax 12 scheduled for liftoff this Saturday, JUNE 14, 1997

See WindTrax website for last minute details and realtime I-NET photos!

www.windtrax.org

Launch Date: June 14, 1997 (this Saturday!)
Time: Estimated @ 1200 UTC/0700 EST (Indiana local)

Location: Challenger Center, Harris Middle School, Brownsburg, Indiana
Elev ~ 800 MSL Lat 39.49.57N Long 86.23.58W

Crusing Alt: Max Alt estimated at 100,000 feet

FORECASTED TRAJECTORY & CLIMB TO 60,000 FEET:
A. 50 mile SE of launch site, while climbing to 100,000 feet, then decending to surface via
parachute
B. 1 hour to 60,000 feet, and 90 minutes to maximum altitude.

PRELAUNCH FREQ's:
Check-ins (HF) 3.860 to 3.870MHz WD9CXU/Dennis Local Talk-in
147.015/R N9KRS/Bob
NETS BEGIN AT 1145UTC/0645 Local
Balloon type: Kaymont 1500GR Parachute is 8 ft diameter custom made
by KB9BSV/Barb
Flight Packages on flight:
Crossband Repeater by W9DUU/Paul Bohr
2m rcvr to 6 m & 70 cm Xmtrs, with voice ID Nicad powered, half wave
vertical ant., 100mW
GPS/Packet by WB9HIS/Chuck Crist
Garmin GPS rcvr, controlled via Paccom Packet & TNC, dwn linked on 446.0
ATV by KT9B/Terry
CCD's - one B&W up-view, one color Horz. View, plus WB8ELK color
graphics board &downlinked on Wyman ATV xmtr via ' wave antenna
FLIGHT PACKAGE FREQ's:
Crossband Repeater - Dwn 52.525 & 444.85MHz (VP) 50 & 100mW Pout
UP - 144.3MHz (VP)
NOTE! PLEASE REMEMBER! VOICE ONLY ON THE CROSSBAND REPEATER!!!

It's there as a current limit. If you short the secondary, the max.
current will be limited by this: all the extra magnetic field goes through
the shunt and NOT through the secondary, and the transformer is less
likely to burn out. OTOH it makes the voltage sag under load, which
results in poor performance for powering things like linear amps, in which
you want the voltage to hold steady. Fortunately for us hams, it's
easy to locate and knock out the shunts. What remains isn't a Peter Dahl
hypersil monster, but it won't cost you hundreds of dollars, either.

## 305. Fire Dept Taking radio Bids - More Details

Since I received tons of e-mail to be more specific here it is:

3 Mobiles needed:
UHF 450Mhz to 470 Mhz
Need PL and common repeater offsets.
Can be dash or head mount.
Power 35 Watts or greater.
Looking for 8 Channels or greater (prefer 16 or >)
Any brand is ok. Best price and reliability wins.
Simple is better. The less buttons the better.

5 Portables needed.
UHF 450Mhz to 470 Mhz
Need PL and common repeater offsets.
Power 5 Watts
Will take price for any brand but HT-1000, Sabers, and Kenwoods prefered.
Looking for 8 Channels or greater (prefer 16 or >)
Simple is better. The less buttons the better.
The more rugged the better. They will be bounced !!!

I hope this helps. Please e-mail prices of units.

Thanks to all who already made suggestions on equipment.

From: Peter_Simpson@3com.COM
Message-ID: <852564B5.0043F1F7.00@hqoutbound.ops.3com.com>
Source record: 93270

The Pixie 2 files are available from:

ftp://ftp.lehigh.edu/pub/listserv/qrp-l/rigs/

pixie2.txt.Z
pixie2.ps.Z

They are in Unix "compress" form, so you will need
an uncompress utility. There is a postscript
schematic and a circuit description file.

I have built the Pixie 2 and it takes about an hour
if you build "ugly" and use a scrap piece of copperclad.
It works. It's simple. No NE602, just a couple of
2N3904 transistors, and a handful of discretes and
an LM386. It's a great starter rig and you don't
even really need to buy the kit.

Be warned, though, that it's a simple rig. Very
simple. No sidetone, crystal controlled and not
all that sensitive, but with a resonant dipole
or inverted vee (it's gotta be resonant) you can
copy lots of signals.

72,
Peter, KA1AXY

Once the unregulated screen supply voltage is two times the regulated voltage, you can never overdissipate the screen under any condition IF the regulator quiescent dissipation is set to equal the rated screen dissipation. Try it. Thevenin's equivalents work in linear dc circuits

Anything beyond perfect is still perfect.

73 Tom

> It's a good idea to keep the control grid supply impedance low, that
> way if you accidentally run a little grid current the bias won't shoot
> up and cause severe distortion.

Does it make sense that::
-1-. 'a little grid current' would 'shoot up' the bias V, cause a large
decrease in ZSAC, resulting in 'severe distortion'?
-2-. after adjusting an AB1 amplifier's grid bias V to prevent grid
current, that the operator would decrease the grid bias V to cause grid
current?

I use a Class AB1 8169 amplifier. If I mis-adjust the bias V to a lower
amount, as the grid is over-driven, the DC grid V and DC grid current begin

to increase. However, as the DC grid V increases, grid I decreases, so the process is self-limiting and the sky does not fall, afterall.
>
.....snip.....
> This 50 ohms grid resistor non-sense that's been published lately is a
> bad idea. Use an L pad or catode drive the tube. ...snip...

Agreed--especially if an inductor is connect in series. I have also seen a published recommendation that a cathode RF negative feedback resistance (Rk) be used. Another solution is to use a broadband, bifilar step-down toroidal transformer and a 12.5 ohm grid terminating R. This is a more satisfactory solution than using large values of Rk to consume overdrive volts. To explain: Screen-to-cathode voltage has an exponential influence on peak emission. Let's say that the grid bias V is 50v and that the exciter produces 100 peak volts (100w-pep into 50 ohms). To prevent grid current, 50 peak v would have to be consumed across Rk. However, this 50v drop will also subtract 50v from the screen to cathode potential--which will simultaneously cause a (Esc1/Esc2)^3/2 decrease in peak cathode emission--which will offset the IMD benefit of RF-NFB.
- A possible workaround to this problem is the (untested) circuit shown in Figure 10 in *Amplifiers* at:
http://www.vcnet.com/measures
If the circuit works as I intended, any voltage drop across Rk should not subtract from the screen to cathode potential.

# 313. FS: Large AM transmitter, 160 - 10 M

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-13 00:00:00 UTC
From: Chuck O'Neal <CONEAL@microtouch.com>
Message-ID: <01bc7808$af6da040$f7512ec0@coneal>
Source record: 93273

Hi Folks,

I have available for sale an extremely well built high power AM transmitter that covers 160 thru 10 meters. Final is a 4CX1500A modulated by a pair of 3CX1200A7's using 5KW broadcast iron. Fully metered, vacuum variables with turns counters, extra final tube, all machining professionally done. Plate power supply not included, needs 3500VDC at up to 1.5 amps, depending on the desired output power. All other supplies built in. Requires about a total of 26" of 19" rack space, plus room for the modulation transformer, reactor and plate supply. It can run very conservativly at 375 watts out...up to....well look up the final tube. Priced at $1.00 a watt at full output. Due to weight it is pick up only in Bolton, MA. 30 miles west of Boston. Email me for details. This is a one of a kind that exceeds broadcast quality in operation and appearance.

Need room for the next rig under construction.

Chuck...K1KW

PMFJI -- but, at those voltages, "...a big filter cap" is NOT "(4700 uF)".
A Big Filter Cap would be more like 47,000 uF.

And, as for the chirp -- with a better regulated and smoothed supply,
you may want to re-visit the transmitter alignment discussions found
in the original article and many of the mod's articles.

Dave,

I think these can still be ordered directly from Radio Shack and the
price is reasonable. I seem to remember paying slightly over $10.00
for my service manual but I could be mistaken.

The service manual has a few foldout pages and several shaded PCB
layout diagrams that probably wouldn't photocopy very well.

If you can find one anyplace else let me know.

A stable 300 MHz signal could be easily obtained with a 50 or 60 MHz PC crystal clock module and a one-or-two-transistor frequency multiplier circuit. The trick is to get the tuned circuitry right -- you have to be able to reject all other harmonics of the 50/60 MHz crystal besides 300 MHz. This would not be a difficult thing to do, but I'd hate to tackle it without a grid-dip meter. Do you have access to any basic RF test equipment at all?

The mixer part is trivial -- you could order one for about $10 U.S. from a company like Mini-Circuits.

Hi

I am looking for a good reference on regenerative receivers using transistors. I have an "Electronic Designers Handbook" that shows a vacuum tube circuit , as one would expect since the technique is quite old. I have heard that there is a "famous" QST article on regeneration but I do not know what the date is on the article or where I can view back issues.

Can anyone help?

Thanks

## 321. Low noise oscillators: JFET or Bipolar?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-13 00:00:00 UTC
From: Stewart Cobb <stu@notme.IntegriNautics.com>
Message-ID: <33A20036.4A8F@notme.IntegriNautics.com>
Source record: 93281

I'm planning a 400MHz narrow bandwidth VCO for a project. Phase noise
is very important. The most critical ingredients in low phase noise
design seem to be (1) hi-Q resonators, (2) emitter/source degeneration,
and (3) low-noise oscillator transistors.

Conventional wisdom (Solid State Design for the Radio Amateur, and
similar books of that vintage) seems to state the following:
- use JFET's up to a few hundred MHz,
- use bipolar transistors up to a few GHz (fT limited),
- and use GaAsFET's only when necessary (higher GHz).

It seems to me from the above that I should start with a JFET
design for 400MHz, perhaps a U310. But ...

The references I've seen are all a couple of decades old, as are the
classic transistor part numbers. Given the speed of technological
progress, has anything changed?

(1) Is the previously quoted conventional wisdom still accurate?
(2) Are there better JFET's available now?
(3) Are bipolars (or even GaAsFET's) now better than JFET's at 400MHz?
(4) Is there some other active element I should consider instead?

Thanks in advance for your advice.
Cheers!

>ARRL handbook based on a TTL gate has gotten me thinking....

Digging into a GE Glow Lamp Manual, it says that the "transmission time",
the small signal delay is only as fast as 6 microseconds for a 5AB (NE-23)
and slows down with lower currents. And that's when the lamp is lit.
The timing charts for relaxation oscillators only go up to 20 kHz or so.

Hydrogen Arc transmitters, the multikilowatt (input power) negative
resistance oscillators used before high power vacuum tubes took over
operated at 1800 to 18,000 meter wavelenghts (166 kHz to 16 kHz),
according to an old book I read. These worked by having an electric arc
with a alcohol drip, with the arc stretched with a strong magnetic field.
These were usually operated as FSK where there were two frequencies used.
One was the signal, the other, the backwave, was complementary. Or they
were keyed as AFSK where a mechanical chopper varied the main tuning at
an audio rate, and the key brought the chopper in and out of the circuit.

I think the "famous" article you mean is H. A. Robinson, "Regenerative Detectors," QST, February 1933, pp 26-30 and 90. It doesn't cover superregeneration--superregeneration and regeneration are related, but different, circuit behaviors--but it's an excellent investigation into the behavior of vacuum tubes as regenerators and practical applications of regenerative detectors using tubes of the day.

Robinson's article applies to transistors only a "macro" sense--that is, in that a transistor regenerator is essentially a transistorized oscillator that simultaneously operates as an amplifier, oscillator and mixer (during heterodyne detection) or amplifier and mixer (during "envelope" detection). The differences between solid-state and vacuum-thermionic physics, and the difference in FET and BJT physics, can make for some surprising behavioral differences at and around critical regeneration among tubes, FET and BJT detectors. I know of no transistor-based analog to Robinson's article.

Regards,

David Newkirk, W9VES

I noted plans for regenerative and possibly a superregenerative receiver in a book of 103 transistor projects, originally written by Tom Kneitel. I suppose that CRB Research would still have copies around.

Hello!

Used Tubes, Pulled from Surplus Equipment, unteseted,
Priced accordingly, Substatnial quantities available:

6AL5 $0.50; 6AU6A $1.00; 6CL6 $ $1.00; 6X4 $1.00;
5963 (12AU7A) $1.25; 8136 $0.75; 8532W $1.00'

TEKTRONIX 465M 100MHz Oscilloscopes, all reconditioned
and calibrated,120 day warranty,shipping free in the USA
$465.00 each!

Amphenol 31-5061 TNC MALE CONNECTOR
for: RG59, RG62, RG140, RG210 COAXIAL CABLE.
New, In original bags, FREE SHIPPING on 4 or more.
$0.75 each!

JAN 6186W, equal to 6AG5WA, sharp cut-off pentodes 7 pin
miniature made by Philips in the USA 1986, NOS, individual
boxes, 5000 available, shipping in the USA: 1 - 199 $4.00,
200 or more shipping free!
$0.10 each

For more ELECTRON TUBES (both new and/or used), various
ANTIQUE RADIO COMPONENTS or
ELECTRONIC TEST EQUIPMENT, please E-mail:

1st let me say I am a newbie to home brewing, which I usually make self apparent by some of the stupid things I type!

I got my crystal AM detector radio working last night... (1n34a diode and 10K ohm phones) Woke the wife up to go stand in the yard and listen to the BBC at 11 O'clock at night! :) <BTW... helpfull hint!> Don't dragg your wife out in the yard in the dark to stand under 133ft of copper wire and expect her to have the same giddy grin that you have. I know I WON'T ever do it again!

For my 2nd project, I am attempting a regenerative reciever!

I am working with the schematic for a renerarative reciever on pg 109 of W1FB's Design note book. I have completed building the circuit on my breadboard and have double and tripple checked parts placement. When I apply 12 volts and slip on my 8 ohm phones I get nothing!
I have two things I am uncertain of:

1) I replaced the 2n4416 with a MPF102 because of availability..... the 2n4416 is due to arrive by mail next week.... the MPF102 was in my parts box already!

2) On the schematic pins 1 & 3 of the LM386 are jumped together and at that connection is a small circle similar to the +12V connection pictured elsewhere on the Schematic! Only difference is that the circle stemming from pins 1 and 3 doesn't have "+12V" printed next to it, that the other circle does. In fact it doesn't have anything except that little empty circle! I assumed it was the counter part of my source voltage.... so I put a jumper between pins 1 & 3 and the negative terminal of the battery.

Is the substituted transistor the problem..... or did I just smoke the LM386? BTW how do you check an IC for short circuits?

Thanks in advance for any assistance you may lend,
GOD KNOWS IT IS NEEDED!

Marty Hawkins KF4HTL

I am a nebie to homebrewing gear. I am attempting the Regen Rcvr pictured on pg 109 of W1FB's Design Notebook. This is my second project if you count a diode detetor which I built earlier in the week.

Pins 1& 3 of the LM386 are jumped to each other.... and there is a small circle there. What is that circle? Is that where I connect the negative lead from my supply voltage? The circle looks very similar to the one on the schematic that has the (+12v) printed next to it!

## 347. App: 6CD6GA sweep tubes

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-15 00:00:00 UTC
From: bry@mnsinc.com
Message-ID: <33a3c551.277700@news.mnsinc.com>
Source record: 93210
Cross-posted to: rec.radio.amateur.boatanchors,rec.audio.tubes,rec.radio.amateur.homebrew

I have a question regarding 6CD6GA sweep tubes.
The ARRL Handbook listing for them doesn't really tell us much.
No MAXIMUM listings other than Plate Dissipation of 20 watts.
Can someone supply the data on maximum plate voltage & current
please?

I would like to build a 4 tube parallel amplifier using these,
in G-G and wanted to know what is the highest reasonable plate
voltage & current to use. I want to get about 500 watts INPUT
in CW and SSB service.

I know it has been done with 6KD6 tubes per the 1969 HANDBOOK
PP 197-200

They run that at 900V DC and get 1200 watts p.e.p. input, so
if I run these at HALF that it should work. ( 667 mA anode current)
for a 600 watt DC input, which seems reasonable for ICAS service
with these. THey have dire warnings about not leaving it "key down"
for more than 30 seconds with over 100 mA flowing!

Perhaps I should use 6 of them?!

Now, they suggest the 6LQ6 as a substitute. Let's see...

Well, these both appear to have a slightly higher plate current rating
than my 6CD6es but not by much. Heater currents are about the same
if that is any indication.

Any thoughts..... I know "Don't use sweep tubes" (grin!)

## 348. HeatSink nylon hardware

Newsgroup: rec.radio.amateur.homebrew

Hi,

I purchased by mail order last year, a nice assortment of insulting mounting
hardware for heatsinks and TO-3 transistors and IC's (LM317K), assorted nylon shoulder washers, screws, nuts but have lost the source company name. Just built a multiple output power supply with several LM317K TO-3 IC's and depleted all my nylon heatsink hardware.

After checking with Dan's Small Parts and DC Electronics, I am running out of ideas.

Please suggest some possible sources. These were just assortments of nylon parts in small plastic bags.

73, W6MIK...Thanks

Marty,
I don't have that book so I can't definitely answer your question.
However, I do have a National Semiconductor Databook which lists the
LM386, and the following info is from that book.

pin 6 = +v
pin 4 = -v (for a single ended supply this will probably be ground)

Inputs are pins 3 (non-inverting) and pin 2 (inveting). For common
audio amp useage input is usually taken to pin 3 with pin 2 connected to
ground. The volume control center connector usually goes to pin 3 when
it is used as the input pin.

Gain of the amp is about 20 when there is no connection between pins 1
and 8.
If a 10 uF cap is connected between these pins (+ toward 1, - toward 8)
the gain of the amp increases to 200.

Double check the schematic and make sure that that pin 1 and 3
connection wasn't supposed to be 1 and 8.

Again, I haven't seen the circuit you are describing so I can't be
certain exactly what the writer was intending, so keep this in mind.

If the IC didn't get hot when you tested the circuit chances are that
you didn't blow it. When you find the correct connections it will
probably work. The FET substitution should be ok.

Homebrewing can be very frustrating at times but the satisfaction you
feel when you have it working makes it all worth it. Hang in there and
don't give up!

Steve, N4EY

The FET sub you used should be fine.

## 352. Re: Low noise oscillators: JFET or Bipolar?

Not a lot has changed in 10 years.
I have an article by Dekker (search for other Dekker references) in UK Electronics and Wireless World July 87 quotes 2N3823 Jfet in a good cct giving -116dbc/hz@5kHz as his best result.
The rf device must also have good LF performance hence emitter degredation.
I once got some very good narrow band performance using a two section helical filter as the resonator, you then need a lot of phase shift to pull the frequency . Other high Q/low loss elements are 1/4wave rigid coax. The best noise floor/ssb noise can come from SAW resonators because you can drive them with a higher current Q about 10000 limits pulling. Could fry pulling by controlled temperature variation.
Good luck.
Doug. .

I'd strongly urge the novice builder to avoid tube equipment. They require dangerous voltages, and usually considerable metalwork is needed to make them safe to be around. ICs and transistors are much safer because of the lower voltages they use, and ICs give you much more functionality as well. Opamps, MMICs, Gilbert cell mixers, etc are also generally more stable and forgiving of design flaws, other than overvoltage, in your project. And of course if you drop one, just pick it up. If you drop a tube, go get the dust pan and sweep up all the broken glass.

wrote:
> Why is it non-sense to use a 50 ohm resistor in the grid circuit?

What Tom is suggesting is that if you calculate the PEAK voltage
across a 50 Ohm resistor driven with 100 (or more) watts, that value
is very close to the value you will impress on the grid. (It's
actually less because the tube starts drawing a bunch of grid current
and lowers the termination impedance dynamically.) The peak drive
voltage would destroy the grid quickly due to over dissipation. This
mode of driving the tube is called passive grid and works where the
grid capacitive reactance is large in comparison to the terminating
resistance and where the voltage developed across the terminating
resistor is appropriate for the tube(s) used..

On the other hand, if you place the terminating resistor between the
cathode and ground the output current of the tube also flows in the
resistor effectively cancel ling part of the drive; it's inverse
feedback. But again, if you take the voltage developed and look at
the voltage needed you still have too much voltage and can burn out
the tube grids.

Many years ago I published an article in which I copied an idea that
ETO used and applied it to a Dentron MLA-2500 ( pair of 8875's). That
approach was to lower the value of resistor from the cathode to ground
to whatever value was needed for the tubes. Then I used a broadband
auto-transformer wound on a toroidal core to step down the drive
voltage (and impedance) to the complex value formed by the resistors
and the cathode. The problem with this method is that you can still
see excessive grid current if you lose the feedback around the tube
because of a loss of plate voltage--for whatever reason. Tom pointed
out the need for grid over current sensing no matter what the drive
mechanism.

Another suggestion, if you are intent on driving the grid with a
passive grid circuit is to use an L pad, as Tom suggested, that has a
total resistance is 50 Ohms. But you put the grid at (what is
essentially) a tap point where the drive voltage is appropriate for
the tubes. Then you can have a broadband input with no tuning that
provides the proper drive voltage. But, you give up the inverse
feedback around the tube that you have in grounded grid so your
distortion products rise about 10 db.

This is what engineering is all about: deciding whether you take the
higher distortion products or go through the trouble of a cathode
drive circuit.

## 357. Component questions: 40673 and xtals

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-15 00:00:00 UTC
From: wmeara@erols.com
Message-ID: <33a410d6.14865396@news.erols.com>
Source record: 93220

Homebrewers:

I'm building the "Bare Bones Superhet" receiver that Doug Demaw described in a June 82 QST article.

I'm gathering parts.

The circuit calls for a 40673 (3N211) dual gate MOSFET mixer. The same device is used throughout the receiver - elsewhere in the rig the MPF102 is listed as an acceptable substitute, but in the mixer Doug recommends the 40673. I'm having trouble finding one of these. Any suggestions?

The circuit also calls for the use of Radio Shack color burst crystals for the IF filter and BFO. As far as I can tell, RS isn't making these any more. I do, however, see a lot of microprocessor crystals available at 3.579545 Mhz. They are listed as having load capacities of 17pf or "series" I suppose I should order the series model, correct? Does anyone have any info on substituting these rocks for the RS color burst crystals in an IF filter application?

Other Q's: I see that silver mica caps are getting hard to find. Will I have any real problems if I just use high tolerance dipped mica caps (in the voltage dividers in the VXO and BFO Colpitts circuits and in the IF filter).

Doug called for the use of Carbon composition resistors. Any benefit or disadvantage in using the film resistors?

Thanks! 73 Bill N2CQR

If you want to see how those are typically used, DuKane Corp
made a lot of amplifiers using 6CD6-G/7867...
If I can find the model number for it you can call them for
a copy of the diagram.

BTW, the audio specs are under 7867, those are listed in the
GE tube manual. Same tube, just re-speced as audio output tube.

Agreed. However, why go to the expense and trouble of designing and
building a separate 2x screen voltage supply so we can use a smaller R to
supply the zener-string regulator? The anode supply is already there. Why
not use it? If the anode V goes away, the screen V goes too. This is
good.

The peak cathode current for a 4cx800A is about 2.4a in Class AB1 service
with 0v on the grid. . If the (50 ohm terminated) grid is biased with
minus 47v (Svetlana) and driven with 100w.pep/100v-peak, it appears that
53v needs to be dropped across the cathode feedback resistor (Rk). Rk =s
53v/2.4a = 22 ohms. Is 22 ohms 'very close' to 50 ohms?

> On the other hand, if you place the terminating resistor between the
> cathode ... snip...

In a Class AB1 amplifier, no current flows between the grid and the
cathode. How is it possible that the terminating R for the exciter can be
placed in the cathode?
>
> Many years ago I published an article in which I copied an idea that

> auto-transformer ...snip...

A flywheel is needed at the input of a g-g amplifier---and a transformer
isn't one. ETO finally woke up and stopped using a transformer input.
Wakeup time, Fred.
>
...snip...

It seems to me that an engineer should read the technical specifications
sheet for the tube being used. Did Fred?
According to Svetlana, this tube has a 2w max. grid. Svetlana says
nothing about using the 4cx800A in other than grid driven Class AB1
service. In my un-"expert" opinion, a 2w-rated grid is not appropriate for
g-g operation with a tube that has an 800mA anode rating..

## 361. Need help! re: Pulse modulation @ 2 meters

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-15 00:00:00 UTC
From: raven1 <raven1@netaccess.on.ca>
Message-ID: <33A43EDF.35F6@netaccess.on.ca>
Source record: 93224

I'd like to experiment using [inexpensive] 2-meter
equipment using pulse modulation. I have an enclosure
which prevents interference to local repeaters and QSOs.

I have available two completed Ramsey Kits: The FT-146
transmitter and it's companion PA-1 power amp, with
expected output of 25 watts or so.

The FT-146 seems to be able to handle pulses at CW speeds
using the PTT input as the key jack, and grounding the
FM mike input.

My old 'scope can't quite tell me if the crystal oscillator
is following pulses at 50 kHz, duty cycle of 10% on, 90%
off nominally.

Can anyone suggest a better way or a sure way to get the
oscillator to follow high speed pulses?

One reason (besides low cost) that I chose a simple kit
is that the parts tend to be easily accessible.

I would think a better way would be to let the oscillator run continuously and use some sort of diode switch to pulse modulate a higher level stage (preferably after any multiplication). Maybe between the exciter and the amplifier or possibly modulating by biasing off and on the amplifier.

I am not familiar with Canadian amateur rules, but in the U.S. pulse is not permitted on two meters.

Great News.

Dan has a new on line catalog. His Catalog has been expanded and list many many

more items than in the past. He also has many quantity purchase discounts listed.

Check it out.

http://www.fix.net/dans.html

Dan has announced that his on line Catalog will be in a continual state of

change. This means he intends to update it on a regular basis reflecting the

latest deals he has to offer and also to take off out of stock or discontinued

items.

Dan is taking advantage of the Internet to quickly get his new offerings out to us.

The days are gone of having to wait for specials or next years catalog to get the

latest listing of goodies.

Enjoy,,,72,,,Jerry...K

## 369. 15 yr old wants to design circuts-

From: diback@aol.com
Message-ID: <19970615232701.TAA06661@ladder02.news.aol.com>
Source record: 93232

I am 15 years old, and I'm realy into radio. I got started with C.B., I then progressed to scanners, then to short wave utilety stations, and I'm currently studeing for my HAM radio liceance. Another field I wish to get into to is RF circut design. I want to be able to take a pile of commponents and, from memory, build a radio. I want to be able to design radios to recieve any freq. I want. ( no, I don't plan to breech the ECPA laws, although I do believe they are wrong, but thats another post!) You know, I want to know about what each indivdual resistor, capacitor, and IC chip in a radio does, just by looking at the schematic.

I am lerning about circut components, and design in my study guide "Now Your talking", but I feel that it won't have nearly all the info I need to achive my goals. Are there
What want to know is, how can I achieve this nowlage, are there any good books out there? I have flipped through Joe Carr's " secrets of RF circot design" or whatever it's called, but I feel it may be above my skill level.
If any one out there can help me, I would be most appreceative!
Thanx,
Scott

Scott,Get a copy of the "Radio Amateur's Handbook" from the ARRL
(American Radio Relay League). You can find their Web site on line at
www.arrl.org.
I'm an RF Engineer by dint of about 25 years of hands on experience, but
most of what I've learned stems from the same kind of burning desire to
learn how to build radios. I got my start through ham radio and the
Handbook was my early bible.
Drop me an e-mail and maybe I can steer you onto some things that can
lead to a career path. Good luck.

Joe

Talking to an ex-truckdriver computer programmer coworker of mine
many years ago, he did it to even out the receive pattern, not
anything to do with the transmitting (that's what linears were for ;-) ).
Just sticking one antenna on the semi tractor gave a lopsided pattern,
and they change trailers all the time, so you can't stick a rooftop
antenna in the center of the vehicle.

```
List Of Stamp Applications (L.O.S.A for short)
==============================================

If you have done something (big or small) with the BASIC Stamp
that you are willing to tell others please use the form below and
write a short description, nothing fancy is needed just a simple
explanation. If you have source code to share that's even better but
it's not necessary.

Then e-mail the form to:

cj@hth.com

With the following as the subject:

L.O.S.A Contribution

Or you could point your Web-browser to the following URL and fill in
the L.O.S.A form on the Web-page...

http://www.hth.com/losa.htm

The latest version of L.O.S.A is going to be posted to the following
mailing lists and news groups, I will update it approx. once a month.

Mailing lists:

BASIC Stamp Mailing List

News groups:

comp.robotics.misc
comp.home.automation
sci.electronics.misc
rec.radio.amateur.homebrew

You can also find the latest version on the following URL...

But if the screen shunt regulator is fed from ANY supply voltage at
least 2X the screen operating voltage, the screen will NEVER be over
dissipated. That includes if you power up the screen with NO bias and
anode voltage.

The only chance for excessive dissipation is if the screen grid is
receiving high values of negative current. While that condition is a
rare operating parameter, negative screen current protection can be
accomplished by measuring the screen regulator return current if you
use a separate supply.

In my commercial PA's I use the blower airflow vane to activate the
bias supplies, and the bias activates the plate and screen supply
(supplies).

>This isn't theory - it's all proven technology. European hams continued

So recently? ;-)

Perhaps you are confused Ian. Good designs were popular here when
tetrode were commonly used (in the 60's and early 70's), but back then
more US Hams understood electronics.

Now, mainly due to marketing and less technical skill, the USA is
attempting to abandon good tetrode designs. Some manufacturers and
their employees recommend no screen protection, no screen stability,
and "easy to tickle" PA grids with no warning or protection systems.

These designs were mostly the result of hard work, being tested and
developed on the 27 MHz CB band.

I've just uploaded a photo of Yaesu's new pager-sized dual-band "micro-HT". That's right, the size of pager... 1/2 watt on internal battery or 1 watt with external supplied power. Yaesu was showing this radio at the SeaPac Ham Radio Convention and ARRL NW Div. Convention at Seaside, Oregon on 6/14 and 6/15. The radio is said to go on sale on July 1st.

Ham Radio Online is a free online web "magazine" about ham radio. No ads. Its run by volunteers. We have nothing to sell. Come enjoy our web site at http://hamradio-online.com

## 386. Power amplifier help needed

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-16 00:00:00 UTC
From: "Philippe Givet, F1IYJ" <phil@Hamradios.com>
Message-ID: <01b91194$8ecb00e0$b3be95c2@f1iyj>
Source record: 93061

Who can help us (radio club) with schematics and/or good ideas for building
a power amplifier with valves for about 500 w output, the new legal limit
in France (last was 250w !). This amplifier will be a club project for hams
who have already build their own HF tranceivers (we know what is a
soldering iron ! hi ! )
Perhaps with tubes like 811A, etc... which not needed 3.5kV power supply !
All answers and propositions are good !
thank you helping OM who think homebrew is a good way to be a ham !

Hello
Do you have soom equipment for sale.Well when you post a Forsale
message on this newsgroup you can now send a picture too the person
that would like to buy your equipment.This will allow him to see what
you have for sale and what kind of shape it is in before you send it
to him.
How can you do this.Simple.Just take a picture of the equipment you
have forsale and send it to me by snail mail.Inclued your e-mail
address and 50 cents.When I get your picture I will scan it and send
it back to you by e-mail.
Heres the address

The point is that mounted 1/4 wave apart (9') they provide a strong
front-back pattern, which would be good for highway use. 6' apart,
the pattern is a mess...

If you are doing something to your antenna, you are doing it to transmit
and receive, it's not possible to differentiate at the antenna.

>Pins 1& 3 of the LM386 are jumped to each other.... and there is a
>small circle there. What is that circle?

Trapper - that circle (or semicircle) is when two leads happen to cross one another on a diagram but are NOT connected in actual practice (I think that's what you're describing). In no LM386 amplifier are pins 1 & 3 connected. Pin 1 normally is wired (via a small electrolytic/tantalum capacitor) to Pin 8 (for more gain). Pin 3 is the audio input (from the preceding audio amplifier or regen detector).

Is that where I connect the
>negative lead from my supply voltage?

No. In an LM386 amplifier you apply 12v to pin 6 (maybe via a 10 ohm resistor). Pins 2 & 4 are grounded.

All of the foregoing is critical, and if you don't follow the above, your amplifier will not work. I'd suggest you read up on schematic diagram drawing conventions, what constitutes a connection, what constitutes a crossover, etc. For many years the ARRL handbook has had a page showing these conventions as well as the schematic symbols for various components.

> Any suggestions?

Bill-

I think the MPF-102 is a J-FET, and isn't a direct substitute, even though it may function in some areas of your circuit.

Perhaps one of the other dual-gate MOSFETs in the 3N2XX series would be available. I think one was intended for use as a mixer, while the 40673 was intended for use as an RF amplifier.

Another point is that the 40673 was one of the earliest dual-gate MOSFETs. The 3N2XX series is newer, but is probably past 20!

(ObHack - okay, a weak one since I just wanted to post
this for sale notice - When making custom interface
connections such as those used by an HP48 or a Fluke97,
I used to use Epoxy poured onto a form mold. Not
any more. Look into Crayola "Magic modeling clay"!
The stuff dries firm, yet flexible, and seals bunches
of little connecting wires in place with no goop
on the host piece of electronics.)

An electronic parts bonanza. Only nine bucks or less!

Computerized, digital, multi-line units to use as-is, or
strip for parts! They're Eagle Telephones, each with the
following, plus more.

o DC-to-DC power supply convertor on an Astec daughter card,
2.5"x 1.5".

o Epoxy encapsulated magnetic reed-switch (and the magnet
-- in the handset).

o 12-button high-quality feel phone pad, about 2"x 3", with 8-wire
flat ribbon cable/connectors.

o 2" diameter, 8-ohm speaker

o Bunch of ICs: CD4081, HCF4069, 2x HCF4066, LS404CB, 2x ULN2003A,
2x ULN2032, SN75176, AMI 8948 (programmed 8048?), LM386

o 3.579575 MHz crystal

o 1.5" x 7" 20 push-button selector panel. Each button has two
colored LEDs and room to insert a small paper label. 34-wire
ribbon cable/connectors.

o 4-digit LED display, with ":" and decimals built onto the display

o One 4-pin, and two 6-pin J-connectors (telephone connectors,
often used on computer network cables, too).

o 8 position DIP switch

o Two 10k-ohm dial pots

o Beige enclosure, handset, and connecting cord.

I'll sell these for $9 + shipping, prepaid. Check exact shipping
costs with the UPS web site cost calculator (my ZIP is 80840):

http://www.ups.com/using/services/rave/rate.html.

---

bit bucket /n./

1. The universal data sink (originally, the mythical receptacle
used to catch bits when they fall off the end of a register
during a shift instruction). Discarded, lost, or destroyed data
is said to have `gone to the bit bucket'. On Unix, often used
for /dev/null. Sometimes amplified as `the Great Bit Bucket in
the Sky'.

2. The place where all lost mail and news messages eventually go.
The selection is performed according to Finagle's Law;
important mail is much more likely to end up in the bit bucket

than junk mail, which has an almost 100% probability of getting delivered. Routing to the bit bucket is automatically performed by mail-transfer agents, news systems, and the lower layers of the network.

3. The ideal location for all unwanted mail responses: "Flames about this article to the bit bucket." Such a request is guaranteed to overflow one's mailbox with flames.

4. Excuse for all mail that has not been sent. "I mailed you those figures last week; they must have landed in the bitbucket." Compare black hole.

This term is used purely in jest. It is based on the fanciful notion that bits are objects that are not destroyed but only misplaced. This appears to have been a mutation of an earlier term `bit box', about which the same legend was current; old-time hackers also report that trainees used to be told that when the CPU stored bits into memory it was actually pulling them `out of the bit box'. See also chad box.

Another variant of this legend has it that, as a consequence of the `parity preservation law', the number of 1 bits that go to the bit bucket must equal the number of 0 bits. Any imbalance results in bits filling up the bit bucket. A qualified computer technician can empty a full bit bucket as part of scheduled maintenance.

Source record: 93070

Doug DeMaw, W1FB has written a number of fine books including Solid State Design for the Radio Amateur, QRP Classics (contains info on building transmitters, receivers, transceivers, and many accesories to them) along with more.

I also have worked at a local TV/VCR retail/repair shop with the owner having 46 years of electronics experience to pass on wisdom. I mention this since working there has helped me and you're old enough to get into a shop like that, if the manager is willing.
I started at the shop when I was 14, I'm now 17 and still puttering on there.

Hello radio amateur freak

I have a Kenwood TS-570D HF tranceiver and like to use it in combination with a transverter for going SSB on 144MHz.

My home build transverter want an input signal of max. 100mW for transmitting but my TS-570D deliver min. 5000 mW (5W).

Do you know if it is possible to reduce the output signal of the TS-570D transceiver to 100mW - by push any buttons on startup or something like that?

What else can I do - 34 dB attenuation is quite a lot.

Yours faithfully

OZ2BKK /Bjarke

## 398. Radio Shack HTX-212/242 Problems

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-16 00:00:00 UTC
From: "Gary E. Euler" <downeast@ij.net>
Message-ID: <33A50176.5AD3@ij.net>
Source record: 93073

Hello to all

Has anyone out there had any problems with their RS htx-212/242
mobile radios. We had a few with the PIN switching circuit burning
a hole through the circuit board. Also the final breaks into
oscillation on the HTX-212 in high power (45 watts). We also have found
the HTX-242 radios are having a problem with the CTCSS and DTMF not
having the right frequency and or low deviation. If you have seen these
problems with these two radios please e-mail me with the details of your
problems and what Tandy did to resolve the problem. A few of us have
been burned by Tandy with these products. I myself went through six (6)
radios starting with the HTX-212. I now have the HTX-242 and I still
have problems with the radio, the deviation is too low on the DTMF
output from the radio. There is no DTMF/CTCSS level control. All
signals go to a single deviation control (RV1) per the schematic.
Please e-mail me if you had problems. We need all the support we
can get on this matter since Tandy states that the radio has no known
problems. If you are going to purchase any of the amateur line from
Radio Shack, do yourself a favor and get the extended service (TSP).
Thank You
Gary

>g-g operation with a tube that has an 800mA anode rating..

There's no problem in principle about cathode-driving any tetrode in class AB1 or AB2, provided that:

1. both grids can be effectively grounded to RF;
2. both grids have the correct DC potentials applied relative to the cathode; and
3. the amplifier is not overdriven.

These conditions can be successfully met using a wide variety of tetrodes, with rated control grid dissipations all the way down to "zero" (the cathode-driven 4CX1000A in the Collins 30-S1).

The practical problem about cathode-driving tetrodes such as the 4CX250B-350A-400A-800A is the base pinout, which is intended for grounded-cathode and makes it very difficult to ground the control grid effectively. That is why cathode drive is not mentioned on the data sheets for those tubes.

On the other hand, cathode drive with RF-grounded grids is the normal configuration for coaxial-based tetrodes used at UHF. The amplifier is more stable, and also input (G1-cathode) capacitance of the tube is much easier to match when it appears in parallel with a low cathode impedance than in parallel with a high grid impedance.

Svetlana's preliminary data sheet for the coaxial-based 4CX1600U (U, not B) shows typical 432MHz data for cathode drive. The control grid dissipation is only 1.5W, and data are given both for class AB1 (-30V with respect to cathode, zero grid current) and AB2 (-30V, grid currents up to 42mA). The 4CX1600U already has a successful track record as the GS-23B, and there are many cathode-driven amplifiers using these tubes. Likewise the Siemens YL1050-1052-1056 TV transmitting tetrodes are constructed and rated for cathode drive.

wrote:

>Hi Tom
> Why is it non-sense to use a 50 ohm resistor in the grid circuit?
> Mark
>ps: I am looking for a simple method of driving a 4cx800.

Hi Mark.

Because the 50 ohm resistor does not set the drive power to a value
that matches the exciter power, except in the case of blind luck.

Most exciters put out best IMD performance at median power levels, say
50 watts envelope power for a 100 watt rig. They also have overshoot
(caused by slow ALC attack time) that often greatly exceeds the power
you have the rig set for.

The IDEAL drive setting is one that holds the exciter in the middle of
optimum IMD performance for the LARGEST amount of the time, then you
generate the least IMD. The correct power setting for this is
generally FULL power with no speech processing, and half power with
heavy speech processing.

Just "throwing" a 50 ohm resistor on the grid of a low bias AB1 tube
like the 4CX800 has several disadvantages:

1.) It increases IMD from the exciter, because the exciter is operated
outside the optimum range for IMD performance.

2.) It increases the likelyhood you will overdrive the PA, since you
will have to carefully adjust drive when you go from barefoot to PA

3.) It increases the effects of already common exciter overshoot (my
IC706 overshoots to 150 watts at the leading edge of speech when set
to 20 watts output! (Many but not all other rigs, including Kenwoods,
other ICOM's and Yeasus also do this! And it happens so fast you need
a triggered scope or storage type power meter to see it.)

4.) It makes the system much less stable and fussier to adjust than
it could be.

AB1 PA's are very critical for screen regulation and require careful
planning, if you don't want to splatter. Many manufacturer's primary
goal is to sell tubes, so they downplay how important good screen and
control grid design is.

The correct grid circuit would involve selecting a grid resistor (or including an attenuator pad) that allowed the exciter to be operated at near full output. The drive impedance could still be 50 ohms. The control grid supply should have low ESR (voltage limited) and include some type of peak drive warning indicator besides a meter.

The screen should be VERY well regulated and properly protected from excessive dissipation.

The only article I've seen LATELY that was a good was written by W6FR and published a few years ago in Comm Quarterly. If an attenuator pad was added to his design, allowing the exciter to operate at nearly full power, it would be a very good design.

More R is not "better". The only thing more R adds is more heat. If it's unavoiidable, then it's unavoidable.

With small tube I use a center tapped transformer for the HV, and run the screen from the HV supply center tap. That saves heat. With big tubes (4CX5000's and up) I use a separate transformer winding on the plate transformer.

The main requirement is the screen supply voltage must be at least two times the operating voltage to provide screen protection.

The ARRL Handbook is still pretty tough to beat for comprehensible coverage of RF issues. IMHO he'd do well to steer clear of the 'TAB' books by Carr et al., as they tend to have the sort of nobody-at-this-publisher-gives-a-hoot editing problems that can really frustrate a newcomer.

As for my personal recommendation, they'll take my two volumes of Jim Williams' 'Analog Circuit Design: Art, Science, and Personalities' from me when they pry my cold, dead fingers off the cover!

Scott - a good book is Solid State Design for the Radio Amateur, published by the ARRL. Also, look out for anything written by Pat Hawker G3VA (available through RSGB). There's a lot of material/circuits put out by the various QRP (low power transmitter) amateur radio clubs.

There's a lot of circuits on the Net - SM0VPO and G3YCC home pages spring to mind. There's links to them through the Australian QRP Home Page (URL below). While you're there, you might want to check out the Novice Notes Online pages and the new "QRP Best Buys" section.

I'd think they're pretty much the same components, and microprocessor
crystals should be OK. In any case you can always vary the capacitance
values in the ladder filter and put an inductor or capacitor in series
with the xtal in the BFO to get the selectivity characteristics you want.
I think for a filter it's important thet the xtals are of the same
brand/type.

>Other Q's: I see that silver mica caps are getting hard to find.

Polystyrene capacitors are a good choice for VFOs. You could try dipped
mica caps, though I've never used them myself.

I have used 1/4 wave rigid coax in mobile VCO's for some years with good
results. I was after the low microphony but I found that the phase
noise
was better than with many other resonators available to me.

I started from a Plessy (I think) application note at 145MHz and after
success there moved onto 430MHz with similar success. Both designs used
J310. Can not (at the moment) find the results I took.

In article <33A20036.4A8F@notme.IntegriNautics.com>, Stewart Cobb
<stu@notme.IntegriNautics.com> writes

However as my application was for the synthesiser VCO in packet txcvrs
this
may not be low noise enough for your application.

>

The point about heat is a good one. For a typical medium-sized PA requiring say 2500V anode, and 360V screen at 30mA, the resistor needs to be about 70k at 65W minimum. Since this dissipation would be continuous, the chain of resistors would need to be rated at well over 100W. The dissipation also increases as (Va-Vg2)^2 for higher anode voltages.

Also there's the matter of packaging convenience. There's no problem if you have a table-top amplifier where the anode supply, low-voltage supplies, metering, control and RF deck are all in the same box. But if you wish to break these functions up into physically separate units, it can be quite inconvenient to cross-connect the anode and screen supplies in this way.

>The main requirement is the screen supply voltage must be at least two
>times the operating voltage to provide screen protection.

Rich is correct to say that the voltage dropping resistor will automatically remove the screen supply if the anode supply fails, and normally I favor this kind of automatic passive protection; but there are other ways to do it.

Almost anything that can go wrong with a tetrode amplifier can be detected by monitoring the screen current, and automatically switching the amp back to standby if the screen current goes too far positive or negative. Screen currents approaching the power dissipation limit are usually way out of line for normal operation, so the alarm circuit can be set to operate some way inside the dissipation limit.

This isn't theory - it's all proven technology. European hams continued to use tetrodes throughout the years when USers were almost exclusively using triodes. We did a lot of design work on power supply and control

circuits, and have been using highly stabilized screen supplies with electronic protection for 10-15 years now.

No, but for $5.00 postpaid, Don Johnson, W6AAQ, the conceiver
of the screwdriver antenna will happily do so. He also will sell
all of the parts and the like for $150 shipped.

DONALD K JOHNSON W6AAQ
BOX 595
ESPARTO, CA, 95627-0595

is the latest address for him. Good luck, the only antenna that works
better is a big BugCatcher, and you can't switch bands while driving with
a bugcatcher.

If you need diagrams for these, the DuKane Corp, has helped me in the
past. Phone number iis 630-584-2300..ask for parts dept.

If, by any stroke of luck the have any manuals for those, that will
give you pretty complete specs on them.

Thank each of you who responded via e-mail..... I got over my fear of tearing something up and removed the jumper between pins 1 and 3 and WhaaaLAaa! I began receiving AM Broadcast stations! (BBC, Radio America, etc... ) and I couldn't tune away from them! They were all booming in at once! I have since found out that I smoked the MPF102's Drain.... so the FET was acting as a diode.

I will be picking up another MPF102 tomorrow and hopefully the regeneration will allow me to tune in some SSB and CW.

Thank again to everyone!

Message-ID: <33a625a4.936910@nntp.infoave.com>
Source record: 93079

Thanks Peter,
I will try and find something on schematic drawing conventions... I have been studying from several books over the last few months.... 1997 ARRL Handbook, Getting started in electronic from radio Shack, QRP Classics, W1FB's Design Notebook, W1FB's QRP Notebook, and Transistor Electronics (a highschool text by Gerrish and Dugger) and I have yet to run accross the symbol pictured on the shcematic I was working with. However that is no defense for my ignorance..... I should have trusted intuition.... but being so new to actually applying all of these things I have been reading about is very intimidating. <GRIN>

I have since removed the jumper I had placed between pins 1 & 3. The LM386 survived, however the MPF102 did not! I smoked the drain and it is now acting as a diode detector rather than a transistorized hartley oscillator. I do enjoy listning to those big AM broadcast station.... even all at one time, but tomorrow I am purchasing a new MPF102 and I am going to tune in and try and listen to you talking SSB way down there in Australia <GRIN>

Congratulations on your first signal! :) One suggestion you may have missed: never, ever buy only one of anything. Like most small-signal transistors and components, MPF-102s are cheaper by the dozen. It is always better to have plenty of spare parts on hand, unless you know your local Radio Shack manager well enough to get him to unlock the store at 3:00 AM on a Sunday morning!

It's great to see a young person with such drive to learn! I'd suggest starting with the ARRL Handbook for Radio Amateurs. It is a lot to read and parts of it are pretty dense but it starts with the math and electronics basics you need to know to accomplish your goal and takes you up through radio theory, with lots of references for further reading and plans for radio projects.

The other thing that will be invaluable is to go to your local ham club's meetings (most will welcome you even if you aren't a ham yet) and make friends with other hams who have built their own equipment. They are usually more than happy to help you learn and may even let you use their equipment, some of which is pretty expensive to buy on your own.

You have set yourself a formidable goal. Guys go to engineering school to learn this stuff, so don't be frustrated if it is slow going. I believe that you can teach yourself a great deal though with the proper motivation and intelligence which you seem to have. Involvement in ham radio and radio electronics experimentation is excellent preparation for a career in engineering and looks good on college applications.

## 423. ICOM IC-120 acessory plug

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-17 00:00:00 UTC
From: Bill Harwood <harwood@ndti.net>
Message-ID: <33A643FE.4F8E@ndti.net>
Source record: 93083

I have an old IC-120 1.2 GHz radio that I got in a trade. I want to do some fancy playing on 1.2. The manual (and the back of the radio) have a 9 pin plug on the back of the radio with discriminator, s level, PTT and some other connections on it.

The socket (female side on the radio) has what appears to be a center plug (like a vaccuum tube) and 9 pins around a circle. I do not know if other ICOM radios of this vinatage had this plug or just the IC-120.

I need to find a source for these plugs (or a plug) and a proper discription of them.

Thanks in advance,

Bill Harwood

That's perfectly true, but the use of a screen-current trip makes it
less necessary to provide 'passive' potection against over-dissipation.

>The only chance for excessive dissipation is if the screen grid is
>receiving high values of negative current. While that condition is a

Unfortunately, excessive negative screen current is not a rare event
with some tetrodes because it can easily happen with incorrect loading
(rather like incorrect grid current in a triode).

>
I think I have most of the published references from QST and HR of that
era, but unfortunately the effective screen voltage regulators all used
tubes, and were abandoned in favor of passive designs using zeners that

probably perform less well.

There seem to be very few designs published in the USA for tetrode power supplies using modern active devices. In fact I can only think of two: the one by KN5S/K5AM in QEX last year and the one published by Rich on his web pages (and maybe elsewhere in print?). If there are any more, I'd really like to see them!

# 431. RDF DDDF 3.5-148 MHz

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-17 00:00:00 UTC
From: don.phelps@infoway.com
Message-ID: <866567595@infoway.com>
Source record: 93091

Advice and ideas sought:

I want to do Radio Direction Finding for:

1) 3.5-7-14-21 MHz to find the power line interference RFI at my
QTH. (It peaks about 21 Mhz)

2.) 147 MHz to compete in our MARC transmitter hunt, which is on foot in
a fairly small area, that I will not have a lot of trouble
transporting a reasonable portable array/ht.
They use a strong 2 meter FM signal that is constant while
it transmitts a message at intervals, then is silent.

I have the RDF citations from the 1993 ARRL Handbook.
Are there other good articles I should read?

I have a zero center little meter I would like to use for direction
indication. I have a meter I could use for field strength.

I like the phase shift detection method from the switched antennas
of the DDDF for it's null over a wide frequency response.

It seems to me, that I could phase detect the chopping frequency of the
RDDF to drive the zero center meter, and pull off a field strength
measurement to drive a regular meter.

I've got a 4047 that I am starting to build a circuit for now, and
am curious about ideas.

BTW, I am 6.2" over 200 lbs, so I could carry a few lbs if it
will make the hunting faster and pinpoint the source more accurately.
I have on old beat up back pack that I could outfit as my RDF unit.

I have my HT or 2 meters, and so far, just an old portable radio
that I might rebuild into a more shielded RDF. But I might be
better off building a whole new radio. A direct conversion
unit built arround an old Millen Gird Dip Meter circuit used as
the calibrated frequency tuned tank for noise detection.

But I am probably better off just buying some sort of portable
SWL radio from Radio Shack.

Any advice out there?

After if I win our clubs' hunt, I am interested in considering organizing
a transmitter hunt along the lines of international competition on
80 and 2 meters with multiple transmitters etc.
We are getting a new clubhouse at the base of Mt Tamalpais

a 2650 ft mountain that has wonderful trails and opportunities for
great transmitter hunt.

Thanks in advance for the benefit of your experience and knowledge.

I also learned by struggle with the ARRL Handbook, but now, when I read
it, I begin to see how my college education and professional experience
fill in the gaps and spot the errors. When it comes to actually
designing things and getting them to work, the ARRL Handbook
leaves too many gaps. Even William Orr's Radio Handbook I found
more useful in building my linear. And the manufacturer's data sheets
and books more useful in using a given device.
My recommendation, at 15, build simple circuits, get licensed,
join a local ARC, find the professional engineers who may be
doing club projects, and get them to take you under their wing.

Apply yourself in school, prepare for going to college so you can
spend the years being taught in an organized manner.

And have fun getting into ham radio.

Not directly, but typically the only game in town is the anode supply. If
you don't take the zener current from there, it has to come from
elsewhere--i.e., another supply.

> I said:
> >>With a shunt regulator you don't need a bleeder, but the

Is it better to put up with a bit more heat, or to build a separate supply?

> With small tube I use a center tapped transformer for the HV, and run
> the screen from the HV supply center tap.

a good choice, methinks.

>That saves heat. With big
> tubes (4CX5000's and up) I use a separate transformer winding on the
> plate transformer.

One problem with adding an approx. 1250Vrms winding for a 8170/8171/8281
screen supply is that an uncheap/uncommon 1.5kV-rated fuse is needed for
screen protection. However, if a separate transformer is used, screen
protection can be a garden-variety 250v-rated fast-acting circuit breaker
or fuse in the screen transformer primary. .

# 435. HELP WITH THE ICOM 706

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-17 00:00:00 UTC
From: jorgegc@mundivia.es
Message-ID: <33a7045a.3423288@noticias.mundivia.es>
Source record: 93095
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.HOMEBREW

Dear friends:

I would like all of you to help me with a problem that I have with my ICOM 706.
Though it works perfectly on VHF, the problem is that on HF it does not receive neither transmit.
With my power meter I have measured only 2,5 watts at full power on AM-FM-SSB, and on my power supply i have tested a consumption of 11-12 amperes.
Though it does not TX and RX, I have put another rig with an another antenna (I have two rigs and two antennas in the roof so I have made this test at home) and when I transmit with the 706 I can hear my voice OK in the other rig, and viceversa, when I transmit with the other rig, I can hear my voice and signal in the 706.
At first time I thought it could be the final power transistors that were damaged, but as it works OK on VHF and I do not know if it shares the power transistors for VHF and HF, I have guess nothing....
I hear nothing in all the HF bands, but I do hear the 1.296 mhz AM (160 meters broadcast band) local broadcasting signal, though not as strong as it used to be.
What it can be the problem?
How can it be solved?
I thing that maybe something has got burned, but What exactly?
PLEASE ANY HELP OR COMMENTS WILL BE VERY KIND OF YOU AS I AM VERY WORRIED ABOUT MY RIG.

Years ago with AB1 amps and 100W exciters we used swamping networks.
Use a chassis box putting Coax connectors on each side and a large
group of resistors to cut the power. We went from 100W to less than 1
watt (reduction of 100). Description was in the W6SAI ands RSGB
handbooks.

I'm a ham operator, and I use relatively high power levels (>1500 watts) on many different frequencies. My television set is not being interfered with, only when my wife wants to watch a video tape does my hobby begin to cause problems. No neighbors complain, so the problem is extremely local. The VCR is a Fisher, and I've been to thier website looking for an e-mail address to write to a technician, but there are none published. I know that many electronic manufacturers try to get by with the least amount of parts, but have available modification kits just for my problem. Any idea how to get 'hold of a Fisher factory tech on the internet? Anybody ever have this problem and fix it? Thanks -Web

I had that problem on 40 meters only. I found that with the antenna
disconnected from the VCR the problem went away. As soon as I connected
the shield of the antenna to the VCR, the problem came back. I ended up
coiling about 20 turns of the VCR antenna cable (RG59) to make a choke
about 10 inches in diameter. This fixed the problem.

I suggest you first determine how the RF is getting into the VCR
(antenna, power leads, or direct through the VCR case). Stop the RF from
entering the VCR with chokes and/or shielding.

It seems that I heard of a way of using a 9 volt battery and pot to put
a negative voltage on a pin on the back of a Kenwood 140 to reduce the
voltage all the way down to zero, to use a tranverter. I'll look for the
notes on it. 73 Mark

## 440. identify CRT

Bjarke wrote:
> What else can I do - 34 dB attenuation is quite a lot.

Hi Bjarke, you can build an attenuator. My ARRL Handbook has 50 ohm pi and 'T' attenuators ranging from 1 to 60dB. Also, your dB calculation seems to be for voltage yet you gave the requirements in watts. 10*log 5000/100 gives me 17dB. For 5w in and 0.1w out, the two parallel resistors in a pi attenuator should be 66.4 ohms and the series one should be 173.4 ohms, non-inductive. The first parallel one needs to have a 5w rating. Five 330 ohm 2w carbon resistors should do the trick.

Try some round torriods around the line running between the vcr and the television. Most rfi sees a length of wire as an antenna and the signal will enter at that point. Some times it can come in through the ac line as well. A solid ground for the rig ,amp,and tuner is a must. A good low pass filter will help also. You can usually get torroids at a hamfest for a buck. If one does'nt do it try 2. Hope this helps. Jim

Scott,
Other than Bill Orr's books and the ARRL Handbooks, try the little
Engineer's Notebooks from Radio Shack. They won't teach you a lot of
theory, but they will have some very simple schematics to start out
your building career. The books are only a buck or two each, and you
can find all the parts right there at Rat Shack so you don't have to
do a lot of scrounging. I started when I was about your age, and I
remember that it was sure tough parting with that yard-mowing money
for those high-dollar books! They might be a good thing to ask your
parents to get you for birthdays, Christmas, etc. I still do that
when somebody asks what I want!
Good Luck, watch that the solder blobs don't roll off on your leg!

I forgot a couple parts of my post. Any high school student may
take classes at the local community college and earn college credit.
So after you take your math and science and get good grades so
you can go to college and complete a career prep, consider taking
the classes at the community college in electronics, circuit design,
etc. Their library and texts are what you want to be studying.
And the units of college credit will be moving you closer to
an actual career.
Apply yourself in school, prepare for going to college so you can
spend the years being taught in an organized manner.

And have fun getting into ham radio.

VCR sucks!
If your problems are when transmitting on 1.8 or 3.5 MHz, it is very
likely your RF goes straight into the video amp. This amp has 100 dB
of gain on these frequecies.

Solution could be to put the vcr in a well-screened box, or just dump
the vcr and tell the yf to start clean up the house instead.

Hello

Heatkit model HW-7 with macthing power supply.
covers 40m 20m15m of the cw band.
1 vfo and 1 place to but crystals
In good order but power supply needs new filters
$100

Mfj 949e Antenna tuner
New
covers 160m to 10m
handles 200 watts
built in dummy load
much more too it just look in MFJ catalog
$120

Add $15 for shipping Add other $15 if you would like C.O.D

I have the same problem with a $500 Sony 4 Head Stereo VCR.

I run a Drake C-Line barefoot into a Vertical, not a high powered
station. When it happened to the VCR, it was actually playing a tape
(IE, not the tuner). This surprised me greatly and I'm not sure that
there is a magic fix for you.

A couple of thoughts though, remove the Antenna connection to the VCR an
check. RF could be be getting in through here and coupling in a odd
places. Put ferrite beads on all the connections going into and out of
the VCR. If neither of these things help then it could be coupling
directly into the VCR head.

Good Luck!
Jim N8CAH

Hi Adam OM,

Instead of just looking in the Internet, I suggest you look in any
issue of CQ or QST magazine. There you will find
advertisements for places that have the components you are looking for.
An example is Fair Radio Sales, in Lima,
Ohio, which advertises regularly. Magazines which are focused on
particular interests, like ham radio, are always
a good source for suppliers of parts. Today's Internet is not a
substitute for reading publications which target
the area you are interested in.
Just a note on semantics and common usage: "air core" refers to
inductors, not capacitors. Inductors have cores,
(which can be nothing more than air), capacitors have dielectric, which
can also be air, or even a vacuum. For example,
variable capacitors with air as the dielectric (space between the
plates) are referred to as "air variables",
not "air core variables".

Good luck with your antenna tuner project. A very worthwhile item to
have in the hamshack; I use mine daily. Incidentally,
the size of your variable depends greatly on the power level you are
transmitting with. 100 watts or less requires only a variable
capacitor with small spacing, such as a "broadcast receiver" variable,
not a huge transmitting variable. The inductor,
likewise, does not have to be made of large diameter wire for this power
level. If you haven't already, check the ARRL
Handbook and Antenna book for proven designs.

73,
Don, W6JL

bit bucket /n./

1. The universal data sink (originally, the mythical receptacle used to catch bits when they fall off the end of a register during a shift instruction). Discarded, lost, or destroyed data is said to have `gone to the bit bucket'. On Unix, often used for /dev/null. Sometimes amplified as `the Great Bit Bucket in the Sky'.

2. The place where all lost mail and news messages eventually go. The selection is performed according to Finagle's Law; important mail is much more likely to end up in the bit bucket than junk mail, which has an almost 100% probability of getting delivered. Routing to the bit bucket is automatically performed by mail-transfer agents, news systems, and the lower layers of the network.

3. The ideal location for all unwanted mail responses: "Flames about this article to the bit bucket." Such a request is guaranteed to overflow one's mailbox with flames.

4. Excuse for all mail that has not been sent. "I mailed you those figures last week; they must have landed in the bitbucket." Compare black hole.

This term is used purely in jest. It is based on the fanciful notion that bits are objects that are not destroyed but only misplaced. This appears to have been a mutation of an earlier term `bit box', about which the same legend was current; old-time hackers also report that trainees used to be told that when the CPU stored bits into memory it was actually pulling them `out of the bit box'. See also chad box.

Another variant of this legend has it that, as a consequence of the `parity preservation law', the number of 1 bits that go to the bit bucket must equal the number of 0 bits. Any imbalance results in bits filling up the bit bucket. A qualified computer technician can empty a full bit bucket as part of scheduled maintenance.

# 458. Re: HELP!!! RF interfering with VCR

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-18 00:00:00 UTC
From: "Jeffrey H. Hill" <GTE/hipiket@gte.net>
Message-ID: <5o9osi$6hh$1@news12.gte.net>
Source record: 93168
Cross-posted to:
rec.radio.amateur,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.video.production

I've a few suggestions, I used to service video equipment.

1) Try first the steps mentioned in the ARRL handbook in the interference chapter. Apply rf chokes to the power cords of both the TV and VCR and a trap (high-pass filter) to the RF cable to the TV set.

2) Check the resistor/capacitor network which grounds the chassis of the VCR for RF. Alternatively, you may want to remove these and strap the VCR chassis to a good RF ground. Also, make sure there are no missing screws from the VCR cabinet, some of these provide a ground contact.

3) If the problem is in playback only, the trouble may be that RF is getting into the rotary head preamp. This is particularly acute as its bandpass overlaps 80 M and comes close to 160 M. If your machine is an older, more expensive model (such as the FVH-575) there is a shield over the drum assy but if yours is one of those newer, lightweight models shielding of the drum is helpful. Check under the drum too. If there is a flexible PWB (a "ribbon cable") for connecting the rotary transformer to the preamp IC you may wish to install a shielded cable. Also, you may wish to install bypass caps on all DC leads going to the preamplifier, especially Vcc and Rec/PB switching lines. Shielding the little preamp PWB worked for me once.

4) If your machine is one of the new lightweight all-plastic sets a radical cure may be indicated. You may try removing the top cabinet, front panel, tape transport, and PWB's and line the pastic base you have left with aluminum foil, providing for a ground connection. Reassemble and your modern VCR will be RF tight.

Fuses are next to worthless for protection of grids. Fuses are great
for preventing house fires.

IMHO, anyone depending on fuses to protect grids needs to read some
fuse catalogs, and pay attention to the specs.

Source record: 93175

ONLY AVAILABLE IN THE:
U.S.A, CANADA VIRGIN ISLANDS, AND PUERTO RICO

BE SURE TO GO TO OUR SITE AND CHECK OUT OUR FREE TRIAL.

Call everyone and tell them to throw away all of your old home, office, fax, pager, voice-mail, and cellular numbers and give them your New "Virtual Office" 800/888 number! The only number any one will ever need.

Are you tired of giving out all of your different phone numbers to everyone? Wouldn't it be nice to be able to give everyone just ONE phone number that will find you anywhere you are? Even out of town, or in a restaurant, or even on the golf course.

Now you can.

We have the answer to all your communication needs. It's called the "Virtual Office".

And this new service is loaded. It comes with features like:

An automated Call Attendant, Live Call Connect (in real time), Fax Sending, Fax Receiving, Even without a fax machine! E-Mail Notification and Delivery, Without a PC!, Outbound calling, Low Cost Long Distance Service, Inbound/Outbound 800/888 Number, Worldwide Call Transfer, Call Forwarding, Call Screening, Full Service Voice Mail, Nation Wide Pager Notification, Conference Calling, Speed Dialing, Auto Dial, Auto Messaging, Temporary Greeting, Unavailable Greeting, Password Protection, Pager Notification, and No Equipment or Software to buy, "Ever".

Priced from $9.95* per month, Plus 10.9 cents per minute per event.

That's less than one phone line would cost per month.

For more information please visit our web sight:
http://www.mynumber.com

* Based on our best priced plan.

What's your point, Harold?
Are you objecting to
* QST in general
* QST covering anything above 10m other than "weak signal"?
* QST having to solicit for authors for construction articles instead
of taking what comes over the transom
* Doing so on the internet (where better than in r.r.a.homebrew?)
* QST offering to pay per page (hey, lots of mags soliciting design
articles try to charge the author's employer per page, this is great)
* Steve because he's one of those suspicious AMSAT guys?
* just being an irrascible o.f.?

Getting articles from people who haven't been reading QST lately
would probably be good. The most interesting construction article
lately came from some west-coast grad students.

Electronics magazines such as Electronics and Wireless World.
Public Libraries (I remember books like Practical Electronics
and Radio Modelling (?) by R. H. Warring being very instructive).
University libraries tend to have publications like the
Art of Electronics; if you can't get in, get to know someone
at a University.
Older books are good for things like basic theory, tubes,
discrete circuits.
You need to look out for up to date publications for
the integrated stuff though.
Second hand books at junk sales, boot sales, and mobile
rallies. Older electronics texts in 2nd hand book shops-
I have found a few interesting books in antique fairs.
Charity shops- look for ones near Universities, you
can pick up surprisingly modern text books that students
have disposed of after they've done their finals.
Free Application notes for devices from component distributors
and IC manufacturers... if you explain you are learning they
will probably help, you may become an engineer using their devices
later. That's if they haven't gone to the wall by then.

>kr4wm@sccoast.net

Well, the first step is to quit using illegal power. The second step is to
get your antenna as far away from the VCR as possible. The third step
would be to improve the shielding of the VCR. VCRs use frequencies
in the range of 2.5 to 8 MHz to record video on tape (the recording is
FM). The heads will respond to the H field of any RF source in this
frequency range. The head preamps are very high gain, and intended
to amplify the weak signal recovered from the tape. You have to keep
the field strength from your transmissions low enough at the video heads
so that they don't override the signal off the tape. The demodulated FM
signal off the tape goes to video amplifiers with response from DC to 4 MHz,
so 75m signals can be directly amplified by these amps too. The only way
to prevent this is to make sure there is enough shielding to stop signal ingress.

Hello,

Can someone please give a simple formula for determining the strength of
the magenetic pull of a coil for a linear motor or solenoid?

something which considers:

the diam of coil
the diam of the wire itself
the number of turns
the length of the wire

thanks,

M.D Lyall

> $150 a published page.

Which reminds me --

There was this guy who went to New York City to find work. After weeks and weeks, the only job he could get was sweeping out a theater on Broadway. It paid minimum wage, and he could barely earn enough to eat, much less have a place to live. So sometimes he stayed at the Salvation Army, sometimes at a church mission, sometimes in a box in an alley. He wound up sweeping out the theater for 10 years.

One day, a theater-goer who'd noticed he'd been in the same sad job for a decade went up to him and said, "You know, you look like a pretty smart guy. And you're a very dependable, steady worker. Why don't you quit this, and get a better job?"

"WHAT?!?!?" he responded. "And give up SHOW BUSINESS??!?!"

I guess it's something about the cachet of being published in QST, along with the outdated concept that "Amateur" radio means you can't have ANY financial interest in it, that keeps the Newington gang offering such pitiful pay and such draconian terms for publishable work. Nowadays, VERY FEW legitimate magazines offer "payment on publication" and buy all rights. I don't think that any magazines with QST's circulation and significant reputation pay so low -- I'd certainly like to hear about some.

And -- in the writer's guidelines, I saw no mention whatsoever about kill fees. So basically, that means that every piece they solicit is a spec piece. (For those of you not in the know in magazine writing, that means "speculation." The writer is gambling that the magazine that has already expressed significant interest in the article WILL actually pay for the finished piece -- or else he's writing it blind, hoping for an over-the-transom sale -- which means he hopes to sell it by throwing the article over the transom at the magazine's front door.)

And I quit writing on spec in college. And -- nowadays with the WWW, there's no reason to write for spec publication when you can

web-publish on your own, and reach 10 times the audience.

C'mon, ARRL. Wise up. Bring your editorial policy into the 20th century. While it still is the 20th century.

I'm 19 and have a similar desire... just got Solid State Design through the post yesterday, it seems like quite a good book with a couple of good circuit ideas. For an introduction to electronics in general I recently looked at "The Art of Electronics" by Horowitz et al 2nd ed. It's a super book, lucidly written and available in most university libs.
Now everyone just has to wait for my 10,20 & 80M superhet (got to think up a catchy name as well)! I'm warming up the (valved) test equipment already!

The review process is not infallible and we should not think of it as a guarantee. Reviewers are not always the final authorities and sometimes not objective regarding what is right and what is wrong. Quite often the author is the one best informed about the topic that he is writing about because of the effort he has put into it. And differences of opinion do exist even on technical matters, despite the common belief that there can be only one *right* answer. However, reviewers can provide perspectives and ask questions that help the author to write a better article. That is very often a more valuable input. A good reviewer also provides civility in his review.

For many years, 1962 to 1983, I had quite a few articles published in QST and didn't get a dime for them. It didn't bother me a bit. Reason: I was doing what I wanted to do because I wanted to do it, and not for the money. Amateur radio was then and is now an avocation. The payment that I get these days helps to meet the expenses incurred and that is about it. I am not in the *business* of writing articles. It is not true that everything that we put our efforts into has a dollar equivalent.

Of course I heard a bunch of Hams making fun of CB'ers putting Tennis
balls on their antenna's to make them transmit better. I told them I
used a tennis ball on my bugcatcher, and they wanted to know how much
it increased the power.

When I told them it was to keep the antenna from grounding against the
body and scratching the paint when I hit trees or bumps, I was greeted
with dead silence.

Sometimes people make the wrong assumption on why these things are
done, find out the facts first, it will keep your foot out of your
mouth.

## 493. 2m/70cm homebrew duplexor wanted?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-20 00:00:00 UTC
From: Kerry Morris <kerry@elcontrol.demon.co.uk>
Message-ID: <kYgiUAAoeuqzEwAq@elcontrol.demon.co.uk>
Source record: 93113

Hi There,

Does anyone have a design for a 2m/70cm duplexor? None of the handbooks I own seem to contain such a thing! Having peeked inside a commercial unit I can see that it is little more than a pair of low-pass and high pass LC filters, and I can see no reason to pay (typically) 25 u.k. pounds for one when I estimate that the parts cost (even with new parts!) is probably less than 5 pounds!
Can anyone point me to a proven design, preferably on the Web, with capacitance values, coil winding info, and setting up tips?

Thanks in anticipation,
--

## 494. Tek 465B Service Question

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-20 00:00:00 UTC
From: stevem@vax.area.com
Message-ID: <5oepk8$t44$1@nixon.area.com>
Source record: 93114
Cross-posted to: sci.electronics.equipment,rec.radio.amateur.homebrew

I recently purchased a fixer-upper Tek 465B scope. I have fixed most of the problems (mechanical / connector related) but the one problem remaining is my inability to use the Focus and Astig adjustments on the front panel to obtain a sharp trace, or dot in the case of no sweep. The dot seems to have a fuzzy or dim halo around it. I have ruled out input channel noise and power supply ripple by various methods.

Intuitively, it seems like the focus and astig controls are working OK, but there might be some other adjustment in the unit which can further clarify the focus. I see no sub-focus or astig adjustents inside though. I also thought it could be some kind of yoke alignment problem, but this scope seems to use only deflection plates.

I'm working without a manual at this point, so I'm wondering if anyone out there who is familiar with this specific instrument might have any ideas on how to fix the problem.

Thanks

Steve Muther WF6R

## 495. Original HF Radio Power Connectors Available

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-20 00:00:00 UTC
From: toms@inconnect.inconnect.com
Message-ID: <5oese3$s3u$1@news.inconnect.com>
Source record: 93115
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

These connectors are now available from ICOM America. The cist of the connector is $1.22 each + $2.00 handling & about $2.00 US Mail. I ordered 10 so this comes out to 1.62 per connector. The connectors come with the pins and will work with Yaesu, Kenwood, or Icom. These are the REAL thing. No longer do we have to buy look-alike connectors from the Hudson River Valley that do not really fit. You can get these from Icom America Parts Division by calling (425) 454-7619. At the prompt, press 3 for parts.

Note that since the handling charge goes down as the order goes up, this may be a good item to ask how many at a club want one. The club could add a dollar for each connector to buy code tapes, etc for new hams.

BTW, I am using Anderson power poles for all my radios but it is still great to have the original soldered to the wire from the power supply. With the power pole, we could forget the power pole to JST (HF Radio) connector.

I guess it depends on where you publish. For example, to publish in the IEEE Transactions on Antennas and Propagation, you are "requested" to pay them $110 per page. If your article runs over 8 pages there is a mandatory "excessive page length" charge of $200 per page. Many scientific journals also expect to be paid page charges from the author's institution.

I would sure like to see an amateur publication that paid even 1/3 of
the
$150 a published page rate you cite. Having written for CQ and Comm
Quarterly recently, I can tell you the even 40 dollars a printed page is
a miracle. I think 73 pays around 30-40 a page also. Many of the
vanity trade publications don't pay diddle squat for an article.
If you want to right for a living, do queries on ideas and sell to
Lady's magazines, in-flight magazines, AARP, and Cosmo if you can
break into those venues. And if you can do your own shots then do so as
you will get a lot more for a pic that 100 column inches of your best
words. Given that a few years ago QST didn't pay a nickel for an
article, $65 a published page is not bad and should cover your paper and
toner costs. What price that 15 minutes of fame.

Shouldn't limit it to CB'ers...Hamdom has lots of sources, too...

How about the guy at the convention (just about any convention)
with the rotating beam and flashing LED's on a tower on a hardhat?

or

the guy at the convention (just about any convention) with the
rubber duckie mounted on top of a hardhat? (I waiting to see
a phased array....I just know it will happen)

:-)

hmmm.....I wonder if there's a market for either/both of them?

73,

Hello,

I have about 100 of these motors left.
Will trade for set of 1/4 watt 5% carbon film resistors......
200 each of all the standard values (161 standard values) as listed in
Digikey catalog.....I am tired of scrounging for parts.
BTW they must be separated by values :-)
So much to do....so little time.

Or will sell for $275 outright.

Any takers?

Thanks for reading this,
Jim

I agree QST handled the matter poorly, they should have just said they made a mistake and explained what it was. Instead they printed exerpts from some of the letters they received (including mine), making it "look like" it was a gang after Rich.

Not that it does any good to say it (minds are probably made up already), but there was never any threat to "pull advertising" because of Rich. Manufacturers largely just ignored him. He didn't affect anyone's sales or market with his constant insults, but pulling an advertisement certainly would have.

The objections to Rich's material came mostly from amateurs, not from manufacturers. One staff member told me after one of his articles they got a stack of letters an inch high pointing out error. When I asked how many letters they got agreeing with him they said "almost none".

When they finally sent his stuff out for review (NOT to people in the industry, but to independent engineers) they did not receive one favorable comment.

QST may be less than perfect, I certainly don't like the way they "handle" some things. But they are NOT dishonest. They are by far the most honest and amateur OPERATOR oriented publication I've seen.

Why don't you critics try to help, if you think they need help, by contacting them about areas you think need improvement. We need quality articles that are properly reviewed for accuracy by panels of skilled amateurs and engineers, not unreviewed voo doo.

## 512. Need slim 2m vertical ideas

Hi,

I need an antenna design for our new 2 meter repeater. It is to be a remote solar powered machine on a mountain which is not noted for nice weather. The requirements are: It must completely fit inside 4" PVC pipe (it would be nice if it would fit inside 3" PVC pipe); it should be at least a half wave, but if we could get more gain that would be great; I would prefer it not be more than about 10 feet long, but we might be able to do a bit more. Any ideas out there?

Paul N1BUG

Hi Jim--

In your post you said:

"Which explains a lot, given that the going rate in the industry is about $150 a published page."

Which ham magazine (or industrial magazine such as RF Design) are you refering to, Jim? I think you'll find that most ham magazines pay the ARRL rate or LESS. Few popular writers I know in amateur or commercial radio do it soley for the money, although a little extra cash is always nice to have. Radio publications aren't exactly "cash cows" in the publishing industry these days, and most simply can't afford to pay big author fees. If money is your only motivation for sharing information with other members of our hobby, then--you're right--it probably isn't worth it.

Source record: 93127

Hello,

I bought a TX that only had a built-in antenna. I am attempting to put it in a new chasis.
I want to add a S0-239 on the new box for an External antenna. My question is what should the "ground" part of the connector should be connected to. As I see it... Im thinking that I'll remove the antenna and and a solder in a jumper from the antenna to the center of the connector. Then should I solder the ground of the connecter to the Negative or ground of the circuit. Like at the point where the negative power wire is put in. Another question is that I noticed in many TX's a capacitor or resistor before it hits the antenna. I figured that was for protecting the TX. What are they used for? Thanks again for your time.
Sorry if it seems like such a novice question.

Victor V.

I've had a couple of articles published in QST and a few others in some of the other ham mags. While the money isn't great, there's another form of compensation that hasn't been mentioned yet in this thread: fan mail! I'm not kidding. I got many, very satisfying notes, e-mails and letters from those two little articles. And occassionally I'll be talking to someone on the air and he'll say, "Hey, weren't you the guy who wrote..." Lots of fun! I recommend it!

> Can anyone point me to a proven design, preferably on the Web, with
> capacitance values, coil winding info, and setting up tips?

You are correct in your observation....the 2mtr side is a LP filter
with a cutoff about 170 Mhz or so...the UHF side is a HP filter with
a cutoff of about 400mhz or so....that way they have MAX isolation
(attenuation) on the opposite band....any ARRL or RSGB handbook
will likely give you the LC values for the filters...3 sections
each band is all you need (each section being one cap and inductor)
The Larsen dualband coupler is a JOKE!!! I opened one up and found
POOR construction for a COMMERCIAL piece of gear...long leads on
the caps, NO interband shielding (which could be done easily with
PC Board soldered in a vertical position between the LP and HP
filters so they dont see each other), and the caps were cheap
ceramic disk instead of higher quality....also the freq response
SUCKED...it did NOT have the range they advertise and the LP side
on 2 mtrs was extremely poor.....loss was more than they advertsied.
I cleaned the board off, added NEW parts (using better caps with
SHORT leads) and got the tuning to cover up to 220 on the low side
and 440 -up on the high side with .3 db MAX loss....now I want to
get rid of the UHF connectors and use Ns or BNCs...

I may have a parts listing of the schematic of an easy 2/UHF
crossband somewhere...I'll see if I can dig it up for ya..

>
> Stephen
> KY6K

You may want to look at the duplexers out of the older cellphones..
they can be retuned (some have been used at 1.2Ghz) and they should
be able to handle maybe 10-25watts with little problem....
BEWARE the connector on a lot of them is a PLASTIC TNC connector..
it is plastic but chrome plated for RF use....they tend to break easily
and cannot be soldered to!!!
Also used 800/900 Mhz duplexers may be retuned for the 902 band with
25 Mhz split (why not a 21.4 split?? thats easier to work with...)
(I would replace it with a true TNC or N)

The screen of an 8171 is rated at 250w continuous. When tuned up with a
33% duty-cycle tuning pulser, the screen dissipation is 1500v x 0.12a x
0.33 = 60w. I used a fast acting fuse in the primary of the screen supply
that would open when the average screen dissipation was roughly 180w. At
first, I blew fuses pretty regularly. After I got the hang of tuning up an
AB1 amplifier, I rarely blew a screen fuse. I never blew a screen.

>
> part with?
The 38 special is supposed to take 12v. 12v for the 5w mod (IRF511) and
there is an 8 volt regulator on board for the rest. I've since corrected

my problems by increasing the size of the filter capacitor BEFORE the regulator. The smaller cap discharged within the 120Hz charge time and gave me a "buzz" (no pun intended") , with a large cap AFTER the regulator the 120 Hz was filtered but slowly discharged from the unloaded potential and gave me the chirp. Now it sounds great on my reciever and consistently get good reports. It's a great rig.

Amen, H.E.
- In my opinion: QST never came close to losing advertising from amplifier manufacturers. Advertisers realize that QST is the only credible ad game in town. The powers that be at QST don't. Based entirely on circumstantial evidence, I'm guessing that about two months after "The Nearly Perfect Amplifier" was published in the January, 1994 issue, Mark and Dave caved in to orchestrated sabre-rattling from some of the advertisers who manufacture amplifiers.
... It seems that the folks who ought to know better have been strangling the Grammerian goose that laid golden eggs .

• How many pages of Alpha and MFJ/Ameritron advertising are in the October 1994 issue of QST?

You -definitely- want to get the service manual for it. They can be had for around $35 and are very well worth it.

There is a full procedure for calibrating the operating point of the CRT, and you really must follow it if you hope to have a good-looking trace and an accurate deflection-factor. The svc manual will give you the procedure.

First, the pwr supplies must be right-on, then you put the CRT bias adjustment at the specified point. This can vary depending on serial number range of the instrument. Then you do the Geometry adjustments, etc., etc., etc....

Try Linda Perkins for the manual. I don't have her addr handy, but a search of this newsgroup with Dejanews should pop up an old msg from her.

Good luck! It's a great scope.

> I agree QST handled the matter poorly, they should have just said they
> made a mistake and explained what it was.

The Probable Mistakes in "The Nearly Perfect Amplifier" List:
1. Saying that some amplifiers have excessive filament/heater V. (they do)
2. Recommending that folks measure the filament/heater V in their amplifier.
3. Saying that some 3-500Z amplifiers have filament inrush I that exceeds Eimac specifications. (they do)
4. Recommendation of using a rheostat to control filament V (like the Collins Radio Co. KWS-1 and 30S-1).
5. Providing information on a ridiculously simple, relatively inexpensive, high speed (2mS) switching circuit that is virtually immune to the problems associated with PIN diode switching.
6. Saying that VHF-lossy conductors make better VHF suppressors. (like the 1926 and 1927 Handbooks)
7. Saying that rectifier "equalization" unequalizes the reverse currents in a series rectifier string. (as stated in the new ARRL Handbooks)

Related Mistakes:

1. Removing Paul Pagel from the loop for the 9/94 issue's Technical Correspondence column.
2. The explanation in the Feb. 1996 issue did not wash. a/ My point-by-point 9/94 rebuttal was not a 'rehash'. b/ The allegation of technical errata in "The Nearly Perfect Amplifier" was not backed up by one specific example.
3. Allowing persons who, by their own statements, either did not fully read--or did not fully understand--a QST article to comment about it.
4. Allowing a person who, by his own statements, does not understand AC Circuit Analysis, to perform an "expert" analysis of how much current flows in each branch of a VHF suppressor.
5. The mail filter.
6. Stonewalling.

7. Devoting 1200 words of QST space to ridiculing my comment about the weakness of rectifier "equalization" whilst the new ARRL Handbook was being printed, which agreed with my comment.

>..... there was never any threat to "pull advertising" because
> of Rich. Manufacturers largely just ignored him. He didn't affect
> anyone's sales or market with his constant insults, ...snip... ....

It seems that the boys on Main St. folded even though they held the winning hand.
RE: "constant insults" in "The Nearly Perfect Amplifier"? HELLO.

A personal comment about Charles Thomas Rauch, Jr., W8JI:
One of the most curious phenomena about Mr. Rauch is that once he makes his mind up, he is seldom disuaded. Two examples: To this day, he remains convinced that in one of the QST articles about intermittent VHF parasitic oscillations, I stated that 'parasitics bend grids'. // Mr. Rauch holds tight to his oft'-stated belief that virtually no VHF current flows in a VHF suppressor's inductor, even though AC Circuit Analysis indicates otherwise.

Hello to you all,

I was just wondering whether there is a FAQ for
rec.radio.amateur.homebrew or an interesting www-link collection?

I am particular interested in building antennas on my own... Any good
links?

Thanks for your help,
Daniel.

The LM386 is an audio chip only. No pin of it would be connected to any coil. However, in some regen receiver designs Pin 3 is connected (through a coupling capacitor) to the collector/drain of the regenerative detector. This stage does operate at RF and there will be a connection from the collector to the feedback coil.

Your other comments are correct.

73,

Peter

I will see if I can find the formula as I once used it often.

A few tips
Length of wire, unimportant
diameter of wire, unimportant

Ampere turns very important
permeability of core and plunger very important

...
Variable inductors up to 40 Amperes; fixed inductors; air-dielectric
variable capacitors; right-angle drives for vertically mounting
vacuum-dielectric variable capacitors, et cetera: Multronics-Cardwell,
516-957-7200, 80 East Montauk Highway, Lindenhurst, Long Island, N.Y.
11757.

Oren Elliott Products, Inc. Variable capacitors. They also make roller
inductors, however, the coil form material is RF-lossy Delrin, so such
inductors should probably be avoided in applications where the power level
exceeds two hundred watts.

> For many years, 1962 to 1983, I had quite a few articles published in
> QST and didn't get a dime for them. ... ...

The most money I made in one year writing QST articles was c.$1200 (1990).
Was it worth it? At one point I was receiving 25+ letters per day and over
a half dozen telephone calls per day, some of which had to be returned. I
was a busy boy. Counting return postage and returned calls, I probably
broke even. However, the 15 Directors are reportedly collecting up to 17.5
kilobucks EACH in 'shakin' hands money'.

>... It didn't bother me a bit. Reason: I
> was doing what I wanted to do ...snip...

Amen, Bill.

RE: "Draconian terms": To me, this is the rub.
• Example One: The first article I submitted to the powers-that-be at QST was about circuit improvements for the TL-922". (1988). The article was rejected like a hot potato. Since Trio/Kenwood was currently advertising the TL-922 in QST, I put 2 and 2 together and rewrote the article. I removed the parts about lethargic T/R switching, filament-inrush overcurrent, mains-inrush overcurrent, filament over-voltage and improving input SWR---which left only the part about intermittent parasitic oscillations at 130MHz. I expanded on the parasitics problem and removed the identity of the subject amplifier. The article was accepted and published in the October 1988 issue. The photograph of the parasitic-arced TL-922 bandswitch subsequently appeared in "Parasitics Revisited" (9/90 - 10/90). IMO, most TL-922 owners would have liked to have had the opportunity to read about the other problems in the TL-922, but they apparently could not because some rich people in Japan didn't want them to.
Note: the article on circuit improvements for the 922 is currently available on my Web site at:
http://www.vcnet.com/measures

• Example Two: When I signed the contract to write Chapter 13 for the 1995 ARRL Handbook, there was a gentlemen's agreement that the copy-editor was going to be Bob Schetgen. However, about a month before the due date on the contract, the telephone rang. It was Newington. The voice said: Rich: Stop writing. The copy-editor mysteriously turned out to be Dick Erhorn and, crouching in the bushes, Mr. Rauch who wished not to be identified.

From my experiences, there are at least three Newingtonian bureaucrats who are somewhat less than gentlemen. Paul Pagel is not one of them. Unfortunately, Paul is not at the helm--nor are the 15 "Directors". ..... Recommended reading: Orwell's *Animal Farm*.

Have an upgraded power supply Drake model L4PS that will work with the Drake L4B and L7 linears. Capacitors were replaced with units having 10% more capacity for improved regulation. Diodes were upgraded from 600 PIV 1 A to 1000 PIV 3A for improved reserve capacity. R11 upgraded from 7 watt to 20 watt rating. Bleeder resistors replaced. Weighs in at 43 lbs without (two) shipping containers. Shipping and insurance alone cost close to $50. Shipped to your door for $200.

Evan

Source record: 93032
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Forgive the newbie question, but...I belong to a local sports car club that puts on autocross events. The starter communicates with the timing van right now using a pair of Radio Shack 49MHz intercoms, which aren't ideal for this task as they don't seem to have noise cancelling microphones, and so the starter's voice is often drowned out by very loud engines. I'd like to find something with a better mic, but can't justify the expense for a David Clark pit headset or the like. Is there anything out there that doesn't require a license? Might the cellphone headsets now available work with a CB, or maybe one of the new FRS radios?

TIA,
Craig Blome

## 576. Regenerative Receiver in Electronics Now

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-22 00:00:00 UTC
From: Kin <kng@pacbell.net>
Message-ID: <01bc7ed0$41789490$8701aace@kinsnt>
Source record: 93036

Hi All,

I just read the Electronics Now, July 97 Q&A column about a Regenerative Receiver and am very interested in building one. As I was trying to gather the parts and trying to understand how it works, I found 2 problems.

1. The 2N3094 is drawn an a PNP, but its a NPN. Which one is right?

2. The coil is a 36 TURNS, 4" DIA. It didn't mention the guage of the wire. Does anybody know what the assumed guage is? And also what's the coil's inductance? I want to know the value so I can enter into my Electronics Workbench to see how it works.

Thanks for any help.

Kin Ng

That particular model of Radio Shack scanner IS am capable in the aircraft band, however modifying that to received AM elsewhere in the scanner's receive bandwidth would be quite a task. The best suggestion that I could come up with for you is to tap the IF frequency from the scanner internally with a piece of coax. (You should be able to find a test point with the IF output on a board somewhere in there. THere are two layers of boards in that particular model. Disassembly is fairly straightforward, but you can find details on it in some of the scanner books.) Once you have soldered coax to the IF section, you need to run that coax out of the scanner and put some kind of convenient connector on it .. i.e. BNC.

This output can be sent to your HF rig, tuned for the IF frequency of the scanner. 455KHz is my assumption. Now, you can receive in any mode that the HF rig is capable of, and you can do it on any frequency that the scanner is capable of. Additionally, you will have all of the fancy dsp, and filtering of the hf rig.

I have not done what I describe, so proceed at your own risk. You will have to do your own research/studies/whatever to make sure that this will both work and (more importantly) not do harm to your equipment. I hope that my suggestions are found to be helpful. Maybe someone else has experience with this kind of thing. What I have described is something that I fully intend to do with my Pro 2006 with the os4566 board installed. I think that this kind of mod is better suited for a base model scanner.

One last note: that pro34 can be cellular capable with a simple modification. THat really doesn't add any value to the scanner because cellular is pretty un-interesting except during the occasional LA riot, and when you want to show your non-radio type friends something 'gee whiz'.

Check that 8417 before you get rid of it. It's not that bad.

Actually, Rick, I was quoting another poster (I believe it was Steve Ford).
Since I can't feed my wife and make my mortgage payment on $65/page, paid on
publication, I have to write for a more generous publisher. I haven't recently researched the field of writing for amateur radio in about a decade
because I've lacked the most significant resource -- time -- to adequately
research, tinker, innovate, evaluate, and write. As Rich Measures noted,
there's a lot more to writing an article than just writing the article.

My publisher pays me by the week -- as it turns out, my per-page rate is actually lower than for QST. Except it's for LOTS of pages.

atkes@imap1.asu.edu (Kevin w9cf@ptolemy.la.asu.edu) wrote:

> author's institution.

I don't know whether IEEE counts as a "vanity" press -- I get a tremendous
kick out of how IEEE makes you pay a dollar every time you say their name.
You pay membership dues, you pay for pubs and standards, you pay to publish.
In return, you are BUYING prestige. You are buying your career. From what I've
seen, each article you pay IEEE to publish -- I mean, each article accepted for

publication -- is worth about $10K in raises, bonuses, and stock
options.

Maybe it all evens out.

Here's what I'd really like to see.

I'd like to see everybody in amateur radio publishing ditch their
colossal
personal, organizational, and corporate egos, and do some positive
things both
for the hobby and for the books and magazines we publish. A long time
ago,
we hams used to invent practically every electronic thing that ever came
off
an American assembly line. We used to have magazines that transferred
that
technology into the hands of fellow hams. Patents, licensing, and
intellectual
property issues aside, we need to be doing that again.

Think we can?

I invented something this morning. Did you?

If you did, can you freely give it to amateur radio? That's the mindset
we
all need to have.

I have a UNBUILT DownEast Microwaves 2400K downconverter kit and the
SHF-LO local oscillator kit for sale or trade.
Still in original packaging with pc boards, all board mounted
components and documentation.

The new value of these 2 kits is $155
I will trade for 1296 parts (ie..for pre-amps, PA bricks ect..)
or sell for $US 80.

I pulled my copy of W1FB Design Notebook off the shelf and took a look
at
the schematic. I think I see what the problem is. Compare the audio
amplifier section of the regen receiver with the audio amp schematics
on page 61, and it seems to me that the part marked LM386 in the
receiver
schematic should actually be an LM380. Hope this helps.

> - Mark N1VQW

- Here's some possibilities on how it might be accomplished, Mark:
1. Hire a couple of Technical Editors who are about 1/4 as competent as George Grammer.
2. In a *QST* Editorial, essentially state that HENCEFORTH: *QST* could not care less whether folks advertise in *QST* or elsewhere. (let 'em advertise in Wayne 'Cold Fusion' Green's *73*, or advertise along with the Isotron, Max-coN, and semi-combustable schlock tuner ads in other ham rags). ... and state that, HENCEFORTH any and all attempts by an advertiser or their agents to covertly or overtly influence *QST* magazine's content WILL be reported in the magazine.
3. Segregate advertising from articles. (like *National Geographic*)
4. Raise the subscription price to whatever it takes to stop *QST* from morphing into a ham equipment catalog. .
5. Make certain that a product works reasonably before accepting advertising for it. For example #1-: a "3kW" antenna tuner whose Delrin coil-form ignites at 1200w, needs to be fixed by switching to a glass-epoxy (G11), or high-quality ceramic, coil-form. .For example #2-: a 3CX800A7 amplifier that supplies the tube's heaters with 14.8v (see Eimac specs.) needs fixing. For example #3. A 3-500Z amplifier that has a filament inrush current of 48a, needs a step-start circuit.
6. The Editor should acknowledge that a monthly technical correspondence column is too slow for resolving technical issues. USENET Newsgroups seem to be ideal.. No organization or person can censor anyone on a Newsgroup. Sure, cyberschmuck/flamers are bound to show up because they seem to be magnetically-attracted to such forums. However, the good news is that each subscriber to a NG has the choice of killfiling those who flame (blather inflammatorily to hopefully receive attention).
7. Pay authors 3% percent per-page of the per-page ad rate. (let us not forget that it IS the articles which sell a magazine, NOT the advertisements)
8. Recombine *QEX* and *QST*.
9 Require that authors explain things so that the average guy can understand what's happening.
10. Have an annual 'Swimsuit Issue' like *Sports Illustrated*. . . . .

. not.

David Clark is top-shelf professional gear, and probably worth the money, but the ARE spendy indeed.
You might look into using a less expensive aviation-type headset. The Flightcom line is very reasonably priced (less than $90 for their entry level model) if memory serves. Virtually all such gear aimed at general aviation markets features noise cancelling mikes.

## 585. Re: QST Call for Articles

Newsgroup: rec.radio.amateur.homebrew

From: tiemann@spot.Colorado.EDU
Message-ID: <5oml8v$r65@lace.colorado.edu>
Source record: 92914

QST also has the extremely irritating position of being entirely mum about antenna performances. The ads aren't allowed to even MENTION gain, and the "technical" product reviews are technically vacuous. For the page of IMD, noise floor, composite noise testing, etc. etc. that they give amps, radios, and other accesories, they give height, weight, and SWR for antennas. I wrote them a letter, "If you say the antenna's the thing, then why don't you give more info on them."

Reply - "The ARRL lab is not equipped to handle antenna gain measurements." Notice that in the current issue, there is a review of a whole bunch of HTs. With their antennas disconnected. Any mention of their performance?

"The antenna's the thing!" They could even stoop to MODEL the performance of various antennas, and state what the calculated performance is, but instead there's just silence.

Does anyone out there have an idea how this might be changed?

Bruce

## 587. Re: advice on repairing traces in rf amp

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-23 00:00:00 UTC
From: Ed Loranger <we6w@qsl.net>
Message-ID: <33AF0868.3E22@qsl.net>
Source record: 92916

First: Never, ever use solder to provide the connection.
Solder is only to merge two metals.

It used to be my job to repair commercially viable
multi-layer PCB's. Each task requires its own solution.

But basically, always bridge with a conductive trace material.
There are flat, pre-cut trace repair kits available. But
90 percent of the time just use a pretinned wire, hold in
place and carefully solder. For RF Circuits, obtain good
solder whetting, and no more. Cover joint with 5 minute
epoxy and it will last forever....

But, never bridge a gap, any gap, with solder alone.

Good Luck!

# 588. EASY MONEY FOR ALL!!!!!!!!!!!!!!!!!!!!!!!!!

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-23 00:00:00 UTC
From: nairb357@aol.com
Message-ID: <19970623010100.VAA01740@ladder02.news.aol.com>
Source record: 93038

THIS OPORTUNITY IS 100% LEGAL AND CAN BRING YOU SOME SERIOUS MONEY IN THE NEXT COUPLE OF MONTHS. PLEASE READ THIS TO THE END, YOU WILL BE GLAD YOU DID. THIS PROGRAM REALLY WORKS!!!!!!

I am sure you have seen these postings all over the internet:"Make 50,000 from a small investment of $5.00. And I am sure that, like me, you have from time to time considered doing this well you can believe that this program works and it is 100% legal.

If you are worried about the legal aspects of it all you can check it out with the U.S. Post Office (1-800-725-2161) and they will confirm that it is indeed leagal!!

Let me tell you how this works and most importantly, why it works....also make sure you print a copy of this article now, so you can get the information off of it as you need it. The process is very simple and consists of 3 easy steps.

STEP 1: Get 5 pieces of paper and write the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 5 $1.00 bills and place one inside each of the 5 pieces of paper so the bill wont be seen through the envelop to prevent thievery. Next place one paper in each of the 5 envelops, each stating the above phrase and a $1.00 bill. What you are doing is creating a service by this. THIS IS PERFECTLY LEGAL!!

Mail the 5 envelops to the following addresses:

#1. Suzy Sanders
120 North 800 East, Bsmt.
Hyrum, Utah 84319

#2. KM King
P.O. Box 773
Pflugerville, TX 78691-0773

#3. M.J. Sarginson
3913 Herrick St.
Flint, MI 48532

#4. M. Voyes
1327 Crosby St.
Rockford, IL 61107

#5. B Lent
7222 West Marine Drive
Milwaukee, WI 53223

STEP 2. Now take the #`1 name off the list that you see above, move the other names up (5 becomes 4, 4 becomes 3, ect...) and add your name as #5 on the list.

STEP 3. Change anything you need to, but keep this article as close to the orignal as possible. Now, post your amended aritcle to at least 200 newsgroups. (I think there are close to 18,000 groups) All you need is 200, but remember, the more you post , the more you make.

Don't know how to post in the newsgroups? Well do exactly the following:
FOR INTESCAPE USERS,

1) Click on any news group, like normal. Then click on to news, which is in the top left corner of the noewsgroup page. This will bring up a message box.

2) Fill in the subject with a flashy ytitle, like the one that i used, something to catch the eye!!

3) Now go to the message part of the box and retype this letter exactly as it is here, with the exception of your few changes. (remember to add your name to the #5 and move the rest up).

4) When you are done typing the whole letter, click on file above the send button. Then save AS. DO NOT SEND YOUR ARTICLE UNTIL YOU SAVE IT. ( so you dont have to type it 200 times)

5) Now you have saved the letter, go ahead and send your first copy! (click the send button in the top left corner)

6) This is where you post all 200! OK, go to any newsgroup article and click the to the news button again. Type in your flashy subject in the subject box, then go to the message and place your cursor here. Now click on ATTACHMENT which is right below the SUBJECT. Click on Attach File then find your letter wherever you saved it. Click once on your file then click OPEN then click OK. If you did this right, you should see your file name in the ATTACHMENT BOX and it will be shadded.

NOW POST AWAY!!!!!!!!!!!!!!!

IF YOU ARE USING INTERNET EXPLORER:
Its just as easy, holding down the left mouse button, highlight this entire article, the press the CTRL key and C key at the same time to copy this article.Then print the article for your records to have the names of those you will be sending $1.00 to.

NEXT
Go to the newsgroup and press post an article, type in your flashey subject and click the large window below Press CTRL and V and the article will appear in the message window.***BE SURE TO MAKE YOUR ADDRESS CHANGES TO THE 5 NAMES.Now re-highlight the article and re-copy it so you have the changes , then all you have to do for each newsgroup is CTRL and V and press POST. It's that easy.

THAT"S IT!! All you have to do is jump to differant newsgroups and post away, after you get the hang of it it takes about 30 seconds for each newsgroup!

***REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200**

That's it!! You will start recieving money from around the world within a few days! You may eventually want to rent a P.O. Box due to the large amount of mail you will recieve.

NOW THE WHY PART!!!!!!!!!!

Out of 200 postings, say i recieve only 5 replies ( a very low example). So the i made $5.00 with my name an #5 on the letter. Now, each of the 5 persons who sent me $1.00 make the minimum 200 postings, each with my name at #4 and only 5 persons respond to each of the original 5, that is another $25.00 foe me, now those 25 each make 200 postings with my name at #3 and only 5 replies each, i will bring in an additional $125.00!! Now those 125 persons turn around and post the minimum 200 with my name at #2 and recieve only 5 replies each, i will make an additional $626.00!!! OK, now is the fun part, each of those 625 persons post the 200 minimum with my at #1 and they recieve only 5 replies, that just made me $3,125.00!! With an original investment of only $5.00! AMAZING!!!!!! And as i said 5 reponses is actually very low. Average is probably 20 to 30! So lets put those figures at just 15 responses per person.

Here is what it looks like:
at #5 $15.00

at #4 $225.00

at #3 $3,375.00

at #2 $50,625.00

at #1 $759,375.00

when your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $5.00 to names on the list,putting your name at #5 again. And start posting again. The thing to remember is, do you realize that thousands of people all over the world are joining the internet and reading articles like this everyday, just like you are now!! So can you afford $5.00 and see if it really works?? I think so... People have said what if the plan is played out and no one sends you money? So what! What are the chances of that happening when there are tons of new honest people who are joining the internet and newsgroups everyday and are willing to give it a try. Estimates are at 20,000 to 50,000 new users everyday with thousands of those joining the actual internet. Remember, play FAIR and HONEST and this will work. You just have to be honest. MAke sure you print this aritcle out now, also try to keep a list of everyone who sends you and always make sure that everyone is playing fairly.

Remember, you don't need to cheat the basic idea to make money!! The more you post the more you win!!!!

GOOD LUCK to all and please play fairly and reap huge rewards from this, which is tons of cash.

This is the fairest way i have seen to share the wealth of the world without costing yourself anything but your time!! You may want to buy mailing and e-mail lists for future dollars.

Please remember to declare extra income. Thanks once again and GOOD LUCK!!!!!!!!!!

Date: 1997-06-23 00:00:00 UTC
From: brahn@ibm.net
Message-ID: <33add73d.0@news1.ibm.net>
Source record: 93040

I have a quantity of RF parts in excess of my personal needs.
Some items are available in large (>50) quantities.

Here's what I have and asking price:

ITEM PRICE
(each)

Johanson 8054 1.5 to 20 pf Capacitors $1.50
(Piston Style)

Piston Style 0.7 to 15 pf Capacitors $1.25

MCL TFM-150 Mixers $5.50
(LO/RF: 10-2000MHz, IF: DC-1000MHz, +10dBm LO)

MCL LPS-109 Power Dividers $2.50
(2 way, 0 degree, 10-500MHz)

MCL MAT-3 3dB Attenuators $1.25
(DC-1500MHz)

MCL MAT-9 9dB Attenuators $1.25
(DC-1500MHz)

AVANTEK VTO-8090 0.9 to 1.6 GHz Voltage $10.00
Controlled Oscillator, 50 ohm, +13dBm output,
TO-8 Case, with mounting hardware.

Cablewave Systems FXA 12-50 NM N Male $15.00
Coax Connector for 1/2" Hard Line
New, In the box!

Pictures and specifications (where available) on the above items may be found on my web page at:
http://members.tripod.com/~Sky_Writer

All parts are unused. Shipping is extra.

73 -- Bruce, WB9ANQ

## 591. Homebrew baluns... Help for a ZL special antenna.

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-23 00:00:00 UTC
From: kiprc@tenet.edu
Message-ID: <33add9a1.1801187@news.swbell.net>
Source record: 93041

I have two zl special antennas and would like to feed them with coax.

Is there a web page or can someone tell me how to make a balun to go
from 300 ohm twinlead feed to 50ohm coax.

Reason. I have a coax switch and would like to be able to utilize it
to change directions of the zl special antennas.
BTW I am operating on 10 meters.

Please respond via email.

## 592. FS: Microwave Equipment

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-23 00:00:00 UTC
From: rnelson@se-iowa.net
Message-ID: <33adf8ed.948280@news.lisco.com>
Source record: 93042

I have for sale 4 Microwave Associates 11 GHz transceivers.

Perfect for a super high speed data link or ATV video link.

They were taken out of service approx. 3 years ago in working condition.

It should not be too hard to move them to the 10 GHz hamband.
I do have service manuals.

The equipment is rackmounted with built-in power supplies. From what I can tell the transmitters are 1 watt output. Each rackmounted unit contains a receiver and transmitter which a coupled together via wave-guide. There is a notch filter in each receiver waveguide to filter out the transmitter.

These units were originally used for video transmission and have a 6.2 and 6.8 MHz subcarrier modulator/demodulator assembles. There is a video input BNC and video output BNC on each receiver and transmitter.

I am wanting to sell all of the units together since some of the current operating freqs. are paired.

Best cash offer takes all!!
Please respond via e-mail and not this newsgroup.

Randy.

Message-ID: <01bc7f94$d30be230$8601aace@kinsnt>
Source record: 93044

The Q&A column of July issue of Electronics Now has a Regenerative Receiver schematic and I have a few questions regarding the circuit and am wondering if anybody can help me.

1. There is a coil described as ' 36 TURNS, 4" DIA.'. Does anybody know what is the assume gauge of the wire? How do you calculate the inductance? I want the inductance so I can enter it into my Electronics Workbench to test it out.

2. The 2N3904 is an NPN transistor but its drawn as an PNP. Its it wrong what the part number is wrong?

Thanks for any help.

Kin Ng

Re Rick's amp' article.
I only know the general outline of the politics surrounding this episode but in my experience, just maybe it's like trying to convince a qualified med student that alternative medicine produces better results, he's going to stick up for what he's been taught for the past five years, or trying to tell an astronomer that UFO's really exist even though he's never seen one.
One just has to be receptive to fresh ideas, and if you dissagree then you're free to carry out your own research to find out one way or the other.
Alternatively, it really could be that the amp manufacturers had ploughed all there hard earned bucks into 'their' design and that they were going to stamp on anyone that got in the way of their profit.
Personally I know which way I think.

Regarding QST articles.

I put forward a suggestion a few years back about doing a back to back tech review of the various HF mobile amplifiers available on the market.
At the time we had: Metron, Ten Tec, Tokyo Hi-Power, and several others, of course we now have units from Henry, KLM, MFJ, SGC etc.
The answer I received was that if they don't advertise in QST, there's not much chance of a review.
Oh well, Life goes on.

Phil G4ZOW/Xtreme mobile.

->Reasonable prices...

->73 Dave

Along the lines of an ARC-5 tuner project, there was an article in 73
by Bob Engle K9QLL showing how to do it. I think the article was in a
late-1970's issue. I have a copy here, but it doesn't show the issue
of 73. Bummer. Looks like a nice tuner, however. Probably good for
several hundred watts.

In 1985 ARRL handbook Chapter 31 you can find two circuits: one "easy" and the other high performance (in that era). If you'll have problem locating a copy, let me know and I will try to scan couple of pages and e-mail them to you.

> what is the assume gauge of the wire? How do you calculate the inductance?

There's a standardized formula for inductance in the ARRL Handbook.
It's for single-layer, air-core, solenoid-wound coils. That's what
this is. Your job is to program a simple spreadsheet and experiment
with wire gauge and winding spacing. The starting point is -- big
enough wire gauge to handle the circuit current, small enough that the
coil is shorter than 2 x diameter. Use close spacing (spacing =
wire gauge), normal spacing (spacing = 2 x wire gauge) and wide spacing
(spacing = 4 x wire gauge). See how the wire gauge and coil
length affect inductance. Look at the difference in inductance when
d = the coil inner diameter, the coil outer diameter, and the midpoint
between those diameters.

Here's the formula from Bill Orr's 23rd Ed., p. 2-9
(I seem to have misplaced all my ARRL handbooks, hihi).

L = (d^2 * n^2)/(18d + 40l)

L = inductance (microhenries)
d = diameter of coil (inches)
n = number of turns
l = coil length (inches)

Also --

n = (10L+/- [sqrt(100L^2 + 36a^3 * t^2L)/(2a^2 * t)]

n = number of turns
L = inductance (microhenries)
a = radius of coil (inches)
t = turns per inch

Your SECOND job is to verify these equations through independent
research before you use them.

> 2. The 2N3904 is an NPN transistor but its drawn as an PNP. Its it wrong
> what the part number is wrong?

There's a 2N3906 that's a PNP (hope I didn't just stick my foot
in my mouth there). On inspection of the circuit, it should be

obvious whether the transistor should be NPN or PNP -- your final job is to call the magazine and/or the author and find out!

From: Rae family <rae4@popd.ix.netcom.com>
Message-ID: <33AF057A.2A22@popd.ix.netcom.com>
Source record: 93056

It's hard to say without seeing it, but the chances are that it is more
than just a cicuit trace, it's probably a transmission line of
particular impedance and electrical length,which gives this type of amp
it's broad-band characteristic. Given that you have to replace the
transistor(s?) would it be that difficult to change the board as well?
Like I say it's hard to give advice blind. If the board is not that
badly damaged, you could try laying down some copper foil to the
original dimensions and see how it works. Most of these amps have very
low Q tuning and are pretty broad-band so it might just work!
Good luck
73 Dan AC6AO

Hi,

I am looking to purchase some audio editing software to use on my home PC. I am presently hosting a radio program and I want to edit liners, cut commercials, and other simple editing tasks from my home. I have a limited budget. I understand that there is software out there ready to install that will convert most pentium level PC's into 2 or 4 track record/editer providing you have enough Harddrive and RAM. Is there software that is capable of taking an off the shelf PC, using a sound blaster card, to edit in a low price range that you are are aware of? Any help would greatly be appreciated.

Tom

You can buy copper trace repair tape at many electronics supply houses
and it is fairly inexpensive. It is usually self adhesive and a small
amount of tining at the seams will complete the circuit.

>I cut the gold plated wings off the mrf247,would those be any good?

You need to use silver solder to effectively solder to gold. The extra
heat needed might further damage the circuit board.

## 613. digital voice keyers

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-24 00:00:00 UTC
From: "Kenneth E. Harker" <kharker@cs.utexas.edu>
Message-ID: <33AF6EEE.168AF0F9@cs.utexas.edu>
Source record: 92923

I may not be able to get into this for quite a while, but I'm thinking eventually I'd like to build a digital voice keyer, primarily to work the rocks on VHF ssb without going hoarse. I've been reading the 1993 ARRL Handbook's article on the "Chiptalker" keyer, but I'm wondering if there're any other kits / partial kits / schematics for voice keyers? The big drawbacks I saw to the "chiptalker" design were:

1) The PCB layout is much larger than I would like - if I could find something like 2.25" x 2" (the size of the Super CMOS Keyer III PCB) I could make a matching device, and I really don't need all the experimentation space if I can get it right the first time :-)

2) The soft divisions between the four memories. This isn't a huge deal, but it would be nice to somehow prevent one memory from "bleeding" across boundaries into the next. Perhaps send a beep to the speaker when you goof.

3) 5-second memories are too short. For ssb meteor-scatter work in North America, 15-second memories would be perfect. Of course, four of these would require an IC with at least 60 seconds of digital memory...

4) No obvious provision for stopping a memory playback. Hit the wrong button in the excitement of a burn and you're probably toast. Perhaps use some sort of microphone pass-through where hitting the microphone's PTT button bypasses the keyer altogether and stops playback, a la the Super CMOS Keyer III behavior with the paddles.

Anyway, just some random thoughts... perhaps the state of the art has advanced since the original 1991 article...

## 616. Testing MOSFETS

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-24 00:00:00 UTC
From: wmeara@erols.com
Message-ID: <33af952b.50514302@news.erols.com>
Source record: 92926

Homebrewers:

Tom Sefranek was kind enough to send me some MOSFETS for use in my Bare Bones Superhet project. I've been working on Boatanchors so long that I've forgotten how to test MOSFETS. Tom mentioned that he wasn't sure if all the devices he sent were good. Is there any way of testing these things without destroying them in the process?

TIA

They look at addresses in the message text too I think!

By the way - does that article say anything about how to attach a shaft to some of those variable caps tat came with nothing to put a knob onto?

I have several of these variable caps I would like to use, but they have no shaft!

## 619. Need help with RFI

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-24 00:00:00 UTC
From: alchazz*@ix.netcom.com
Message-ID: <33AFD23B.FEE@ix.netcom.com>
Source record: 92929

In my neigborshood there is a new source of RFI. It sounds like a scratchy hiss on the two telephone lines I have. You can ignore it while talking, but it kills the modem. I also can see regular white zap marks on the TV on channel 5 VHF(no cable). Can someone tell me how to snoop out the source? Who should I complain to after I find the source?

Thanks in advance.

Hello -

Looking for manual or copy for Motorola (manufactured
by Measurements Corp) RF Signal Generator model
S-1320. This generator is the transistorized version
which resembles the older tube model T-1034. The
sig gen would be usually used in the commercial
two way radio trade.

Will pay any and all costs for copying, or will copy
and return at your pleasure. Please check your file
cabinets, and help me get my swap meet treasure
back on the air!

Thanks for reading this.

Check the Sporty's Catalog (1-800-LIFTOFF, I think). David Clark
headsets are expensive because they're also designed to protect your
hearing in high noise environments. If hearing protection is not as
much an issue as getting the message through, you may want to look at
some of the lighter weight headsets. Most, if not all, will have
noise canceling mics.

I certainly agree with you. Anyone understanding either physics or
theory would have no problem deciding who was correct. I'm surprised
it got past the ARRL for so long, but at least they attempted to
correct the error. It would have been all avoided if they reviewed the
stuff before publishing it, or back when readers first complained, but
what is done is done.

You are certainly correct, UFO's and voo doo has no place in a
technical publication.

Source record: 92933

Sure. If you can identify drain, source and gate. Do you know whether they are N junction or P junction?

First, tie the source and gate together and apply voltage between drain and source-gate. If it draws current, (For god's sake, stick a current limiting resistor in series.) it is not an enhancement mode FET. Then isolate the gate source, and apply a variable voltage (negative) to the gate. When the current is reduced to a microamp, you have identified pinchoff Vp. Bias it for whatever application you want to use it for and go.

If it does not draw current as above, it's an enhancement mode device, and requires a small forward bias (no current required, just voltage) to turn it on.

Conversely, did Tom give you any part numbers that are identifiable? ie, not in-house numbers?

: to install that will convert most pentium level PC's into 2 or 4 track
: record/editer providing you have enough Harddrive and RAM. Is there
: software that is capable of taking an off the shelf PC, using a sound
: blaster card, to edit in a low price range that you are are aware of?
: Any help would greatly be appreciated.

I use "Cool Edit" from www.syntrillium.com. It's shareware...and IMHO,
the best shareware I've seen for the PC. It's $50 for the full version,
and $25 for the "lite" version. The evaluation version is full-featured,
you just are limited to using only two of ten or so function groups at
each invocation of the program... for what you describe, the "lite"
version is probably plenty. The full version includes noise reduction,
filtering, flanging, ... lots and lots of stuff. The user interface
seems quite easy to me. I have no financial interest in the program
or Syntrillium, just a very happy customer. Download it; when you
register, you get a magic number to enable what you bought. Even has
a very decent manual that prints nicely formatted.

> N6URH

- I used to go to VHF/UHF antenna contests, Bruce. There were consistent discrepancies between the claimed db gain of manufactured antennas and the db gain that was measured on the antenna range. If you guessed that the measured gain was consistenly lower than manufacturers' claimed gain, congrats.

Since there is no antenna range in Newington, accepting antenna manufacturers' claimed gain seems to be the only way this might be changed. However, accepting such would be like having a fishing contest where each fisherman is required to report the size of the fish he caught, instead of bringing the fish in to be measured by a panel of judges.

It seems to me that no db claims in antenna ads is one of the things that QST has right.

The burned traces may have been strip lines. If so, you have to use the same width for the replacement, and bond it down to the substrate. You can get copper foil in various widths with an adhesive backing from the suppliers of prototyping and repair materials. But if the traces are just short interconnect wiring, which is likely,, then you can bridge the burned gap with a piece of bare buss wire laid on the board in place of the burned section and soldered in place.

Just changing the transistor is going to slightly change the tuning, so the slight change in tuning you'll make by repairing the traces isn't likely to be significant at 2m. At upper UHF, it could be significant.

>I own a radio shack pro-34 scanner, which is FM reception only
>and I am looking to add AM receive capability to it.
> Does any one have a suggestion on how?
>
> Markos@webtv.net.

The PRO-34 is not FM only. It receives AM in the VHF-air band.

An AM/FM switching modification is pretty simple to perform
in many GRE-made scanners which already contain AM and FM
detectors, e.g., PRO-34, PRO-39. The CPU usually provides a
logic level output line which is connected to base of a
transistor switch or input to a simple IC switch. That
switch selects either the FM or AM detector output to be
routed to the audio amplifier input.

While I don't have a schematic for the PRO-34, I will use
the later PRO-39 as an example. Pin 13 of the CPU (located
on the logic PCB) provides +5 VDC to resistor R227 (on the
AF PCB) in NFM mode and ground (approximate) in AM mode.

One could insert a single pole, three position switch
between CPU pin 13 and R227. The common on contact would
connect to R227. The other 3 contacts could be connected
to:

1. CPU Pin 13
2. 5 VDC
3. ground

When the new switch is in position 1, the scanner would act
normally -- AM in VHF airband, NFM elsewhere. In position
2, the scanner would use NFM mode regardless of frequency.
In position 3, the scanner would use AM mode regardless of
frequency.

I recommend you order a PRO-34 Service Manual from Tandy so
you can determine the relevant components and their
locations specific to that model.

>out the source? Who should I complain to after I find the source?

It sounds like an arc of some kind. (what other TV channels are in use in your area? Are all other TV channels higher than 5? Arc interference is usually much worse in channels 2-6 than anywhere else.)

You need to start with a bit of detective work.. Is the interference continuous, or does it come and go? Is it on only after dark? Or only during business hours? Only when it's dry? (or wet, or windy?)

Common sources for this kind of thing are cracked or dirty insulators on power lines, defective advertising lights, and electric motors with defective brushes.

If you can associate the noise with a business, you'll need to work with the business to get them to fix it. If it seems to be weather related, you'll need to work with your electric utility.

Since it is on the telephone lines, I would have the
Tel-company investigate immediately! They're the
pro's and can probably troubleshoot over the line.

I think you can report a bad line using 611 or something,
look in the front of the phonebook.

If they fail to fix the problem, you will have to isolate
the problem i.e. Radiated or Conducted emissions. Try
a portable tv or something and walk around with it.

If the problem is not evident on the portable, maybe it's
in the powerlines. RF chokes are in order for the Phonelines
and line cord.

Hope this helps.

Hi Scott,

Go to Motorola. (www.motorola.com?). They have pages on their
RF power devices with schematics. The kind of amplifier you are looking
for is usually cheaper to buy, though.

>what is the assume gauge of the wire? How do you calculate the inductance?
> I want the inductance so I can enter it into my Electronics Workbench to
>test it out.

You'd have to assume some values and then plug those into a formula to work it out. I'd start with a wire gauge of 0.5mm and assume closewound windings. I can't understand the people who work in gauges - fine when you're buying wire, but when you're using unknown wire from an old transformer, you wind 10 turns of it onto a pencil, hold a ruler (calibrated in centimetres) up to the coil, and you can read off your wire gauge (in mm).

I'm curious - why do you want to measure the inductance anyway? With these types of projects, you wind what you think is reasonable, get the receiver going and add or remove turns if you want to change youre frequency coverage.

>
>2. The 2N3904 is an NPN transistor but its drawn as an PNP. Its it wrong
>what the part number is wrong?
>

Having not seen the diagram or the article, I can't really comment. However, because we like to build things with negative earths, I'd suspect that these days 90% of transistor receiver circuits use NPN rather than PNP devices. If in doubt, I'd assume NPN.

My own experiences with regen receivers is that FET sets seem to be better and smoother operating than junction transistor circuits.

Have you thought of using one of those digital voice recorder keyrings?
They're very compact and will even drive a full-sized 8 ohm speaker if
required. Their audio quality isn't too bad either.

You could even have a bank of three or four of them for different styles
of calls. Of course you'd need some sort of timer circuit - a 555 should
be OK.

The one I bought was on special at $10.00. However the usual price is
$20-30 ea.

Well, that one makes sense, at least. Improves coverage over wearing
the HT on your belt clip with the ant radiating into your abdomen.

Improves rx, lets you run low power, battery lasts all day, . . .
So what if it looks goofy?

Hi,

A friend of mine has a Butternut (HF6V?) HF vertical antenna. The local hoodlums broke the doorknob capacitor that's in the 30 metre circuit.

Can anyone enlighten me as to the value of this capacitor, and suggest a possible source besides Butternut?

Thanks in advance.

Why do you need to contact Fisher? (are they even still in business?)

This is typical in low-end electronics, but it can be solved. Most hams that have been around for a year or two could solve it (or greatly reduce it) for you in a heartbeat. If you know any experienced hams, try to contact him or her.

First, have you done any checking to see what the source of the RF is? Is it coming in on the AC line? Are you using the video feed into the TV or the composite signal from the VCR into the TV? Are you using good, shielded cable (in either case)? Are your connections good?

If all of the above checks out, have you tried winding the offending lead around a ferrite core for several turns?

If you are using the composite output from the VCR, have you tried a simple high pass filter? Does your "ham" equipment have a low pass filter? How about a good ground?

Contact a ham with some knowledge and he will go over this with you and you should be able to solve it in 30 minutes with maybe $5 of Radio Shack parts, if that. There is no point in contacting Fisher until all the easy fixes have been tried (99% of the time these will work).

Bob:

Finding the capacitor is easy, the problem is finding the proper size hexagonal female nuts and then getting them soldered to the capacitor. I managed to break off one of the nuts on the 40 meter capacitor and lost it. I tried to find a replacement or at least something that would do but was unsuccessful and finally had to call Butternut.

Let me warn you, Butternut isn't shy about charging a pretty steep price for the things.

You can get the pF value from Butternut. The actual capacitor
doesn't have to be an EXACT replacement as long as the value
and the physical dimensions are close.

Current and voltage handling requirements are important, but
you may be able to use molded "postage stamp" silver mica caps
if you're QRP. Alternatively, if you've access to any smaller
fixed vacuum caps (ARC-5 surplus, mainly) these could work.
I typically see a few of these at every swapfest for less than a buck.

And I've successfully repaired an HF6V with a handful of assorted
doorknob caps hand selected for value and series-paralleled.

OR -- take the easy and sanitary way out, and send Butternut
some buck-olas.

Many amateur radio operators have contaced us in recent months regarding availability of affordable electronic analysis and synthesis tools. We have now released Version 2 of the Professional Partnership (PP) Program. While there is a one-time $975 charge, the PP program may be distributed throughout a club, organization or company. Of special significance is the profound level of Wireless/RF/Microwave capability included.

The PP Program includes:

Nodal Circuit Analysis with True Two-Node Port Definition
Unconstrained Noise Analysis
Transmission Structure Synthesis & Analysis
Over 40 Single & Coupled Topologies
Strip (Planar) Structures
Wire Lines
Coaxial Arrangements
Waveguide (Non-TEM) Topologies
Passive Filter Synthesis
Lowpass
Highpass
Bandpass
Prototypes
Practical Reactively-Coupled Realizations
System & Receiver Design Support
Link, Terminal & Radar Analysis
System Architecture Characterization
Spurious Analysis
Transmit & Receive
Coincident & Tuned
Preselector & Output Filtering
Phase Noise Analysis
Time Domain Effects
Frequency Domain Effects

500+ Page User's Manual with Examples & References

Acquire a single PP Program package for your club, company or organization, and you will be furnishing all of this needed capability to every designer, not just one! Our competitors are furious with us for having created the uniquely progressive opportunity. It seems they're still using dongles to hinder access to their own products.

Please contact me for additional information.

For the IRF parts, International Rectifier was the first-source
supplier and should have data sheets available if you call a sales rep
or their literature distribution center and ask nicely.

Usually the data sheets are free if you know how to ask.

For the others -- An Allied or Newark catalog may turn up a supplier
or manufacturer, and then you work backwards for the data sheets.

If you can find the part listed in a cross-ref or service-part
substitution book, you might get enough data from a similar part.
back before fire was invented, SK and ECG used to provide some
very complete catalogs that -- while not good enough for UHF
and microwave work, would sure help for audio and small-signal
VHF.

Part of the hobby is tracking down the information!

I have the original patent here with me, in hand.
It specifies 67 picofarad for the 30 Meter section.
the 40 Meter cap is also 67 pf. the 80 meter cap
is 200 pf. Hope this helps.

Patent # 4442436 filed Nov.16, 1981. Approved 4/10/1984.

Here's the IBM patent server:

http://patent.womplex.ibm.com/
Select Patent Number search (This is at the bottom)
and Enter:4442436 in the dialog box.

At the top of the summary page, you'll see that you can
actually look at each submitted graph/text of the patent
in its entirety.

Don't know where to get these though....
Good Luck.

## 681. AA7 Superhet Project

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-25 00:00:00 UTC
From: tonyz@rose.hp.com
Message-ID: <5os8et$qol@rosenews.rose.hp.com>
Source record: 92991

Ok, so I set aside building TRF broadcast receivers..they got boring.

I decided to build a Superhet using the old shouldered glass tubes i.e. 6K7G etc.... use a separate oscillator, 3 ganged tuning condenser with similar capacities, (would need a 'padder' to compensate for tracking problems) and an S-meter. I planned on winding my own rf coils just like the TRF's.

Well, then I decided that since I already had a supply of the standard 7pin bottles, decided to go with an AA7. Incorporate an RF amp, use an aerial instead of a loop to begin with...12BA6 feeding the mixer 12BE6, one stage of IF 12BA6 to the 2nd detector 12AV6 and finally 25C5 output. I used another 12BA6 for the high-mu triode section to see if I could get an S-meter amplifier going.

Found a lot of the stuff I needed including chassis at Alltronics in San Jose off Zanker Road. The rest came from AES etc etc... No power transformer needed! Usually the most expensive part. I hate that.

I've never built a TRF or Superhet in my life and after my success with TRF's decided that a superhet cant be any worse. For anyone learning electronics basics and/or wants to restore antique radios instead of just collecting them, I would highly recommend going through the same motions I did to learn about the pitfalls and successes of AVC, coupling, tracking etc etc. I'm still learning, but in the process came out with a pretty good AM radio that competes with the standard AA5's of that day. Well, a cheap one anyway.

The coils were all designed around standard coil winding formulas found in the ARRL handbook and various other sources. You need lots of sources to figure out what one alludes to but never makes clear.

Most of the radio is just normal biasing math, i.e. consult with the tube manuals for tube specs and find a value to start with, I came up with the same numbers used by most AA5's. Tubes are very tolerant and you can be several hundreds of ohms off one

way or the other I found. The coil design became
the most critical in insuring this wasnt all wasted
effort. If I didnt get the coil dimensions and
number of turns right, if I didnt couple the IF
windings right, and since they werent going to
be shielded...they could...well, you can see
what I was up against.

I decided against using a tuning condenser with
similar capacities. I thought I would also have to
use a 3 ganged condenser: RF, Mixer and Osc.

Decided to go for the standard Superhet 2 ganged
RF and Osc section. RC couple the RF amp to the
mixer. Easy.

The rf coil was calculated to work 550 to 1700 Kc,
and so consequently I wound the osc to track 455 Kc above
that. The IF transformers were easy and I used ceramic
trimmers. These came out to be about 30pF once adjusted.
Having a Scope and RF Gen is mandatory in addition to
your usual DVM or Triplett VOM etc.

I used Lucite dowels of the proper diameter as cores
and bank wound all the coils. Bank wound coils require
an extra step once you've calculated the needed inductance
for the frequency you want to cover. Also you need to
figure out how to keep the winding all 'bank wound' and
not end up in a big sloppy ball. I did this by winding
the coils first on a similar dowel with some tape over
where the wire would lay, this would allow me enough
play (once wound) to get the coil off the dowel so
I could transfer it over to the actual dowel I would
use. This turned out extremely successful and the coils
almost look commercially-wound. They had just enough of
an extra diameter that I could also moved them up and
down the dowel, which was important when I was adjusting
the coupling between the IF coils.

When I first powered up, the thing was oscillating like
crazy and I figured 'Oh well, so much for my radio-design
days' but pondered and floundered along until I realized
that the sqealing was due to something other than the
local osc not tracking the RF amp. I found the oscillator
wasnt even oscillating. The coil is the Hartley type
with a tap at 10% up from the ground end. I had to ground
the (RF ground) tuning cap body AVC and also had the coil
ground at the same RF ground point. Shoulda worked I thought.
Well, as soon as I chassis-grounded the osc coil, it worked
great. Had some distortion, turned out to be bad 25C5.

New one on order. In the meantime, I had to go with a
35C5 and yank the pilot lamp out to give me the needed
filament voltage.

I have plenty of gain, and for local stations, good selectivity,
even for unshielded IF coils garage-built by joe blow
from Kokomo. I plan to add another stage of IF which
should give even more gain and selectivity. I am able to
hear KNX in LA here near Sacramento etc.... I do have some
image problems which I need to check out, but otherwise
without any modifications to the coil, my bandwidth was
from about 850 kc to 1650 kc. I added about 25% more
inductance to the Osc coil and was able to trim its
trimmer to cover from 640 to 1650 kc now. I am having
problems getting the S-meter to work correctly. Using
a bridge circuit which follows the AVC voltage. Doesnt
seem sensitive enough and I cant zero it. I found that
the filament string has lots of influence regarding gain,
etc and that it is important that the string come out
to 120V or you are going to see significant degredation
in performance.

I decided that until I could figure out why I couldnt get
the bridge circuit for the S-meter to work, I'd just
meter the plate current of the meter amp. So, the meter
kind of works backwards. That is, the meter is pegged
for no signal, and then when the AVC is strong, the
negative AVC starts cutting off the plate current
and so the needle dips. No big deal. But it still
bugs me, I'll be working on that.

If any of you would like help trying something like
this let me know, I'd be happy to try to help.
It is very interesting, you know. Thanks to
John Bell in Roseville Ca. who has been down this
road before gave me a lot of assistance. He has wound
his own IF coils etc. too.

Zack Lau wrote:

>Is there any interest in really high performance designs?

>What is really "good enough?"

I'm sure that there's always interest (well, I would say that, wouldn't I?)

It's very difficult to find transmitter and receiver designs that can cope with VHF DX and contest situations.

Right now we're probably at the stage of development where the best-equipped stations can survive if a near neighbor is beaming straight at them, and their own antenna is oriented away in some random direction. But both receivers will probably fold in a head-to-head situation, so there's still more work to do.

Development goes in cycles. With receivers, some years ago it was VHF front-end overload; then we built better front-ends and the problem moved to IF overload (or HF transceiver overload for people using transverters); then we upgraded our IFs and the problem shifted to synthesizer noise; and now maybe we're coming back around to the VHF front-end again.

Meanwhile we're also trying to improve our transmitters - and of course encouraging the other guys to do the same!

At each step we gain some real advantages, but they also uncover another layer of the problem.

The important thing is always to analyse the WHOLE SYSTEM, and not just rush to use all the latest devices. For example, GaAsFET RF amplifiers were a step backwards until we learned how to use them properly: they can't offer much additional S/N improvement over a front-end that's already good, but their very high gain can ruin strong-signal performance.

>I've been thinking of using an image reject mixer using
>phased FET rings--which ought to get the mixer's input
>intercept around +45 dBm. This could accomodate a very
>low noise power FET preamp, perhaps with some clever
>feedback to get the gain down to more reasonable levels
>for a very high input intercept.
>
Exactly my point - every dB of unnecessary RF gain will chop close to a dB off the top end of the dynamic range.

The Suffolk transverter is quite carefully designed so that it doesn't have any conspicuous weak points. Unless the HF RX front-end is very robust against strong in-band signals, it will overload before the transverter does. This approach also gives the best performance out of a system made using relatively low-cost devices. The down-side is that if you want to upgrade the performance of the transverter, you'll probably have to re-design every single stage.

>Also, if one enjoys metalworking, one can devise much
>better filters than typically used. I just built an
>interdigital 432 MHz filter with a 2.7 MHz bandwidth
>and 2.5 dB of loss.
>
Out-of-band interference is a separate problem really. If you can build an RF amplifier with a moderate-Q (ie low-loss) input network that can handle strong out-of-band signals without folding, then you can afford much more filter loss after that stage, and present the mixer with a highly band-limited spectrum.

OTOH, if the RF stage needs some extra protection ahead of it, I agree that must involve heavy metal.

>Along similar lines, it looks like the 100W MRF 177M Gemini
>FET pair would make a dandy class A amplifier at the 10
>watt level. One question I haven't quite resolved is noise
>from a switching power supply. Often, you still end up with
>AM modulation from the switching--which is awfully tough to
>reduce below -100 dBc.

Tell us more, Zack - how many volts, how much power gain, how little IMD... how many $$$?

## 684. Some BA instrumentation. SEM & Pyrometer heads.

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-26 00:00:00 UTC
From: BOB DUCKWORTH <bob@atl.org>
Message-ID: <33B2ACB0.29B9@atl.org>
Source record: 92809
Cross-posted to: rec.radio.swap,rec.radio.amateur.homebrew,sci.electronics.equipment

It's not an 'old radio' but has the same appeal here.

It's got a filament and a vacuum and is almost a tube.

It's the ISI-40 Scanning Electron Microscope (SEM)
that I'm picking up tomorrow. Alas, no manual and no
pumps.

On the off chance someone has a manual for this beast...

Oh, It's got a CRT too so that's two tubes :-)

Also a couple of other odd bits made there way over here today.
They appear to be some sort of optical pyrometers.
Each has an objective lense, a partially silvered mirror
to split 'light' path between eyepiec and what appears to be a
photodiode(with a chopper in the path to the diode)

I mention these as possible swap fodder for a manual and maybe a pump
(which I'm sure will require additional swap bits).

-bob

## 685. Re: Simple MOSFET test?

Yes, you should read an infinite resistance both directions with
your ohm meter. You can short the drain and source leads together
and measure to the gate. Be very careful with these guys: take
proper static (ESD) precautions. Work on a conductive surface,
and ground yourself to that surface before picking up the transistors.

Another test you can do that will give you a more quantitative
indication of gate leakage current: Connect the ohm meter between
drain and source...positive to drain, if it's N-channel. Connect
a large enough voltage from gate to source to turn off the channel.
Disconnect that voltage, letting the gate float...shielded from
excessive hum and electrostatic pickup. Watch the meter show you
how the gate capacitance discharges with time. For example, if
the gate capacitance is about 1pF, and it takes 20 seconds for the
channel resistance to change enough to indicate a 1 volt gate
change, then the leakage current is about 1/20 of a pA. I've
often seen leakages like that, or even less, on good transistors.
Obviously, you can calibrate things if you want to get a bit more
complicated. If you do have gate leakages down in that range,
you'll never see them on the typical ohm meter!

: another evening.

Maybe that's OK for Lou, but I've got better things to do with my
evenings! Lots of good surplus places around with transformers.
"Surplus Center" in Lincoln, NE, and Herbach and Rademan in
Philadelphia have stuff like this, and so do many other places.
I'd be happy to scout them for you and sell them to you for the
price of two evenings of my time, billed at consulting rates...

:-)

(Plus, televisions with 60Hz power transformers are getting pretty
hard to find these days! Mine, even 20 years old, seem to be all
off-line switchers or just direct floating chassis.)

## 688. Specs of Parts

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-26 00:00:00 UTC
From: don.phelps@infoway.com
Message-ID: <867278036@infoway.com>
Source record: 92992

I received the response that a little more info/explaination
would be useful to help direct me toward data sources.
I go to my local parts store, and look
at their solid state devices & prices, then figure
if those pieces can be used in any of the circuits I have
under consideration. They don't give many specs, and
when they do, often incorrect specs.
Project wize, I'm interested in a 2mtr amp from 2 watts to...
(Maybe class E?)
For example
Where do I go to find mfg data sheets for the following FET's:
In particular, I need freq spec, are these useful for powersupply,
HF,VHF transmitter, rf switches for rdf etc.

BUZ45 MOSFET, N-CH $4.95
BUZ53A 1000volt 2.6 amp TO-3 $7.50
BUZ74 500volt 24 amp TO-220 $1.25
HXTR6103TXV NPN,Bi, Hi-rel, 4 GHz, HPAC100 pack 5.95
IRF441 MOSFET, N-CH TO-3 $3.95
IRF512 MOSFET, N-CH TO-3 $1.25
IRF840 MOSFET, N-CH TO-3 $ .95

MTP12N20 FET 200V 6amp N-CH, TO-220 $1.95
MTP8P08 FET 80volt 8 amp P-CH, TO-220 $1.95
VN-64 MOSFET 60V 10amp 80watt TO-220 $2.75

Thanks for a point in the right direction.

>Lee / AB7ON
>ab7on@paclink.com

make 'em.

Get 3 olt TV sets the big kind with huge xfmrs in them, and remove the
last (secondary) windings.

Wrap 10 turns of wire around the primary and hook it to a 10 K ohm
10 watt resistor.

connect primary to a line voltage and measure both primary and
secondary voltage.

Divide secondary voltage by 10. You get Turns-per-volt value
AT THAT INPUT VOLTAGE. if that is your regular voltage, fine.

If not, take a ratio to tell you what you would have in the secondary.

then with your new T/P/V value, figure how many turns you got to
have to get the voltage you want.

The first one should be an evening's work. The other two might take
another evening.

Good luck.

Source record: 93001

Is there any interest in really high performance designs?

I've been thinking of using an image reject mixer using phased FET rings--which ought to get the mixer's input intercept around +45 dBm. This could accomodate a very low noise power FET preamp, perhaps with some clever feedback to get the gain down to more reasonable levels for a very high input intercept.

Also, if one enjoys metalworking, one can devise much better filters than typically used. I just built an interdigital 432 MHz filter with a 2.7 MHz bandwidth and 2.5 dB of loss.

Along similar lines, it looks like the 100W MRF 177M Gemini FET pair would make a dandy class A amplifier at the 10 watt level. One question I haven't quite resolved is noise from a switching power supply. Often, you still end up with AM modulation from the switching--which is awfully tough to reduce below -100 dBc. What is really "good enough?"

For the IRF parts, go to www.irf.com, which is International's web site. You are likely to find that they don't have data sheets on the web site for what you want, but they have a fax-back service. The web site lists the fax-back numbers for each part. They also have a cross-reference look-up window on the web site, and you might find the BUZ numbers in it. The HXTR looks like an HP number...I'm not sure what we have on our web site for part data sheets! ;-) I'm spoiled by our internal info systems; sorry. I think the VN number is Siliconix...and I think you can get there thru www.temic.com but I'm not positive about that. Who does the BUZ parts? Siemens? Motorola? (Moto did one or two BUZ parts, but has dropped them, I believe...may be identical to a Moto number.) -- Check web sites. The MTP parts are Motorola and should have data sheets on www.motorola.com.

I saw a picture in a trade magazine recently of a room full of catalogs at a semi mfgr being cleared out: they are going to delivering them on the web and on CD-ROM. I sure like that better! I can get data sheets pronto, almost all are in Adobe Acrobat format which prints nicely, and the "books" (CD-Roms) take up MUCH less space on my bookshelf.

If the web sites I mentioned aren't right, you should be able to search for each company and find obvious hits.

Source record: 92814

I am looking for something to receive 20 40 & 80 meters... I don't care if it operates by means of Transistors, Tubes, Rocks, or squirrel power! I would just like to be able to receive the above bands on a rig that has a readout or dial that will give me an idea of what fequency I am at.

I live in the Greenville South Carolina and could drive to pick up Rcvr if your location is close enough. Otherwise we could arrange prepayment and shipping.

Price wise.... I am looking for the cheapest thing I can find.

"Duh" thats a given... every buyer wants the lowest price.

What I guess I mean by the above is that.... I am not preoccupied with asthetics. If its missing a few knobs or lights are burnt out thats fine... Notch filters etc.... are not required. I don't have a lot of cash... I am a young married trying to pay for a new home and land..... and a boat anchor at the right price that I could build filters for etc... would be right up my alley.

Anybody feeling charitable.... I may be more trouble than I am worth.... but I will sing your praises high and low! <Grin>

>
>Does anyone out there have an idea how this might be changed?

If you think people ready to fight over code vs. no-code, you should see
the arguments about which antenna works best, or how to measure
gain properly, or if gain was measured properly. Even the best of the
antenna modeling software isn't always right either. You tell me
what's best, a butternut vertical, a gap vertical, or a cushcraft, and
I'll
know which one you presently own. It's difficult to measure how well
something as simple as a vertical works. If you use an antenna range,
there are certain requirement that have to be met. If you just set up the
antenna as a typical ham would on a mast a certain height for a quad,
log periodic, or quad, you'll still get complaints that the height used
wasn't the proper one. If you use a Field Strenth Meter (FSM) 3 miles
away to make measurements, some will claim that's too far, and others
will point out that you can't tell what the takeoff angle is for such an
antenna with such a simplified test. That is of course assuming that
your FSM is either properly calibrated or has a repeatable scale with
known accurate means of antennuation.

Note that I haven't even gotten to whether dBd or dBi should be used
as the reference scale, and the question of what real world reference
antenna also raises questions. LET'S be honest, in the real world
everything about antennas as set up by the average ham is guess
work. Oh, we can use SWR meters, power meters, antenna analyzers,
in the end all we can do is use the antenna and see if we're happy with
what we can hear, and who can hear us.

CALLING ALL LITERARY MINDS!

I am trying to compose a coffee table book on the topic of EXCUSES.  To add an original flavor to my project
I am attempting to derive my research entirely from people I come in contact with on the Net.
If you have, or know of, any interesting, unique, or even bizarre excuses, and would like to participate in this experiment
in creative literature, please reply to this message with your excuse.  Any excuse that is used in the published version will
receive full literary credit.  Thank you in advance for helping a fellow netizen.
Long live free speech!

Sincerely yours,

Jason

Hello all,

I'll be calling CQ on 50.400 AM all this weekend.

Was a bummer I missed out on lastnight's good opening.
Need to check the radio before I go to bed.

Sat I'll be on from 10:00 pdt - 22:00 pdt
Sun from 10:00 pdt - 18:00 pdt (later if there's openings)

Hope to hear from you...

P.S. If you have not checked out my 50AM web page, please do so......

http://www.geocities.com/Hollywood/5860/50am.html

Seems to me that you'll be needing two pumps, Bob. The first
is a mechanical roughing pump to get your first vacuum. Next
you'll need an oil based diffusion pump to get your hard vacuum.

A good place to look for these pumps is at a university's
surplus property sales department. I've seen a few go out to
auction this way.

There are a lot of seals in an SEM, Bob. Hopefully you will
have access to something like a helium leak detector otherwise
your pumps may be hard at work with little to show for it. The
electronics are generally very reliable with most electrical
problems occurring at the connectors. The roughing vacuum pump
needs to be vented away from the instrument to prevent oil
condensation from contaminating the SEM. Cleaning the column
and being able to pull a good hard vacuum will be your two biggest
maintenance concerns. I wish you the best of luck with your new/old
SEM as these are very fascinating instruments to work with.

I am posting this for a friend

FOR SALE or TRADE

- one Motorola Maratrac UHF land mobile radio
- 450 to 470 MHz 100 w, 99 channels, remote radio head
- includes the speaker, microphone, deluxe control head
- fully operational
- valued at about 250-350 dollars wholesale according to the local motorola dealer
- cost about $2000.00 new at 1990
- manufatured in 1990.
- radio model number is T74XTA7TA7BK; ser. number is 776AGY0835

Interested ????

Please email me at n1jfd@juno.com
Serious offers only please !!!!

>as described in this month's QST) with a handheld to work the OSCAR
---
>satellites as long as a proper receiver is used?

This is a quibble, Gary, mostly to clarify my understanding. It doesn't seem like MCW is inherently evil, as that represents a variety of emission types. Given a sufficiently pure sine wave as modulation, isn't emission type J2A (SSB) almost indistinguishable from CW? Even A2A (AM) ought not take more bandwidth than twice the frequency of that sine wave.

The problem comes with what is probably being suggested ['haven't seen the relevant QST yet], that is, MCW using emission types F2A or G2A (frequency or phase modulation) which uses completely unacceptable bandwidth for satellite transponders [as opposed to repeaters, such as on MIR, AO-27 or AO-21 (currently SK)]. The best you *might* be able to do is to make a fake microphone out of a suitable value of resistor and a telegraphic key. If you've a remembered to turn off PL (*important*), i think you'll be sending an FM carrier with very little modulation which might be something like CW that sounds bad and drifts horribly, and probably should only be tried at a time when almost no one else is on, to find out that one *could* use a given satellite if one obtained the proper equipment.

In short, don't use FM with a non-FM satellite!!!

Now, can anyone suggest a homebrew 2M transmitter (CW or SSB) so those of us who don't have $300-$500 (or more) and/or an HF rig lying around can experiment with such things without potentially causing serious interference?

-- KD6PAG (networking old-timer, RF newbie)

P.S. You can often find me trying AO-27 on most daylight passes that give at least 20 degrees elevation in the S.F. Bay Area. If you can hear it, then you can probably work it.

> Bill W0IYH

Bill, I could not agree more.

A true "Amateur" just does things for the sheer love of it. This is founded in the very root of the word in Latin.

As a kid, I learned a lot out of an ancient(even then) ARRL handbook. When I was given the opportunity to write part of a new edition, it felt like the opportunity to repay a big debt. The sort of debt that you can't just throw money at, the sort that you can only repay with personal effort.

I put my best effort into it, and really tried to do the best job that could be done. I think I put in more effort than anyone could have impelled me to by mere money. The feedback I've received both from Newington and from readers, has been very encouraging. I keep the messages in a file that I take a peek at whenever things seem to be going wrong and I need a boost to cheer me up.

The ARRL did indeed pay for the material, at a rate they set. I wondered what to do with the money after the British tax man had made off with his 40%. In the end, I decided to buy something to act as a special memento, something that would last a long time. I would have been happy to do it for free, my professional activities provide enough income and keep me in new toys.

For people not in fulltime employment, the youngsters, the oldsters and those between jobs, payment for publication helps them for the materials or parts used, and allows them to afford to create/build further things that can in turn be published.

Professionals have plenty to offer amateur radio. People like Bill, myself, and many others can spread information about how some of the things we've done can be applied to amateur radio.

Amateur radio, equally, has a lot to offer professionals. It's what started me off mumblety-mumble years ago. If I have a satisfactory

career, when I know what I owe it to. Amateur radio is where I go to look at things from a different viewpoint, it's where I go when I want to play with some idea that doesn't fit in with my boss's definition of "business". It's where I sometimes go looking for inspiration.

Even if the likes of QST, QEX, Radcom stopped paying authors, there would still be people prepared to submit good articles, but the real loss would be the reduction in output from a number of people with interesting things to say, but less fortunate in the ability to fund their costs.

I once read "Remember, it's the amateurs who run fastest, jump highest...."

Cheers
David GM4ZNX

>73, Scott, N0EDV

The transistors used in that PA were selected for Class C service.
It is likely that they have a rather limited range over which they'll
exhibit satisfactory linearity. This means that even if you add a
stiff bias circuit, the power output you could achieve with good
linearity would be disappointing. It is pretty hard to get good
linearity out of a high power solid state PA operating at 12 volts
anyway, the impedances get very low, so specially designed
transistors are typically used for linear service.

## 719. 70cm UHF transmitter schematics wanted

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-28 00:00:00 UTC
From: Hans.Ameel@ping.be
Message-ID: <33b59259.8254924@news.ping.be>
Source record: 92829

Hello all,

My name is Hans Ameel, ans I am an electronics student.

I would like to build myself a 70 Cm transmitter for packet use, since
I dont like using my HT for that purpose.
I already have a qualifying receiver.

So what I need now is a schematic of a UHF transmitter with a power
output of circa 5 W

diagrams of 2m VHF transmitters are also welcome, of course, as are
any useful building tips.

Kind regards,

Hans.

>to the "chiptalker" design were:

I designed a voice keyer called the "Contest Card" that plugs into the
PC and is compatible with the top three contest logging programs. It
was published in the Sept. 1993 QST and re-printed in the 1995-1997
ARRL Handbooks. There are some features in the design you might find
useful if you decide to design your own.

I have kits available. Check my website @ www.QTH.com/w9xt for
more info if you are interested in going that route.

>
>1) The PCB layout is much larger than I would like - if I could find

>to the speaker when you goof.

When you record with the ISD chips they keep recording until you stop.
I did one design (I work for a contract electronic design and
manufacturing company) for a customer that could not allow overwriting
other messages. It used a PIC micro to time recording. It would stop
the record when the time was up if the user did not stop before then.
.
>3) 5-second memories are too short. For ssb meteor-scatter work in
>North America, 15-second memories would be perfect. Of course, four of
>these would require an IC with at least 60 seconds of digital memory...

Get the ISD2560 chip (DigiKey sells them). That is 60 seconds long.
I modified one of my voice keyers to use that chip and have used it
for meteor scatter.

>4) No obvious provision for stopping a memory playback. Hit the wrong
>button in the excitement of a burn and you're probably toast. Perhaps
>use some sort of microphone pass-through where hitting the microphone's
>PTT button bypasses the keyer altogether and stops playback, a la the
>Super CMOS Keyer III behavior with the paddles.

If you design your own, allow provisions (or modify the Chip Talker if
you go that route) to remove the CE (chip enable) to the ISD chip.
That will abort a playback. I put that feature into the Contest Card.
If you hit the <ESC> key with most of the software that supports it,
the message playback stops.

>Anyway, just some random thoughts... perhaps the state of the art has
>advanced since the original 1991 article...

ISD has really enhanced its product line since they first came out
with their first parts. Some of the new ones are set up for
interfacing with micros and have a couple of minutes of storage. They
are really the way to go if you want to build a voice keyer.

Have fun!

## 727. HELP with UPS Part Info

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-29 00:00:00 UTC
From: kelmgeo@saba.kuentos.guam.net
Message-ID: <5p5c4j$cuu@lehi.kuentos.guam.net>
Source record: 92837

This is not exactly amateur homebrew, but I can not think of a better place to post this. If anyone has an idea of a better group, please let me know...

Do you have access to a IC Master or other IC index? I'm looking for a IC/volt-reg/hybred whatever for my ups, the number on the IC/module is

first line 97 0280
next line I*R 9338A

The * is the trademark sign for International Rectifier. It's a flat black module, oblong, 2-3/8" long, 7/8" high and about as thick as a standard lead
pencil. There are 13 pins in-line on the bottom. Also two screw holes on either end of the front side that holds it to the heat sink.

I'm guessing that it's the problem as the ups has output in both line and battery mode. The ups just will not charge the battery once the line power returns.

The UPS is an Exide Model 4095 1,500 va.

The shops here can not cross the number, so I can not order one.

THANKS for your help!

ghk

The July/September 1997 Digi-Key catalog (http://www.digikey.com/) has
nylon Phillips-head machine screws (2-56, 4-40, 6-32, 8-32, 10-32), hex
nuts, as well as nylon spacers, etc.

Regards,

David Newkirk, W9VES

There is a company that will custom make any transformer for you.
They can repair existing transformers or build from scratch to your
specifications. I have no idea about the pricing but look in:

http://www.mnsinc.com/bry/mega/repairs.htm

and

http://www.mnsinc.com/bry/mega/partsupp.htm

I think you can find them there!

MAGNETIC SURVEY INSTRUMENTATION

Prices include shipping in Lower 48.

MEDA uMAG-02WB Handheld, battery-operated digital fluxgate magnetometer. Sensitivity: +/- 0 - 20.00 - 200.0 - 2000 milliGauss F/S, DC-400 Hz (-3dB @ 400 Hz ref to DC). Analog output +/- 2.000 V F/S. Linearity .02% or better. Absolute accuracy +/- 0.5% or better, traceable to NIST. With 10 meter cable and transverse probe, 6 spare batteries in storage case, multiple-battery harness for up to 8 batteries (approximately 12 days continuous operation), analog output cable w/BNC (to oscilloscope input), manual, calibration certificate, transit case. In new condition. Current price from manufacturer is $900. Sell at $450. Three available: all three, $1300 including 3-channel chart recorder (see below).

DEXSIL MAGNUM 310. Handheld, battery-operated, micropro-cessor based 3-axis digital induction milliGaussmeter. Auto-ranging; 0.04-9.96 milliGauss (+/- 2%), 10 - 99.6 milliGauss (+/- 5%), 100-996 milliGauss (+/- 5%), 1.00 - 10.0 Gauss (+/- 5%) for 60 Hz signals in 60 Hz mode. F/S accuracy in 3rd harmonic mode is +/- 5%. In braodband mode (40-310 Hz @ -3dB) accuracy is +/- 10%. Displays all three vector components plus resultant or resultant only. Has low battery indication and automatic shutoff. Fully self-contained. WIth carrying case, manual and calibration certificate. New price $695. Used, very good condition; $250.

LEEDS & NORTHRUP SERVO RECORDER 136-304-304-304-00-00-00-L0088-L0088-L0088-6-BV-000. Three-channel servo recorder, modified for potential inputs. Can be internally adjusted from +/- 1 millivolt F/S to +/- 2V F/S. Set at +/- 1V F/S. Chart speed @ 60 Hz 2cm/hr or 2 cm/minute (at 50 Hz = 1.67 cm/min or 1.67 cm/hr). Internal line voltage selection for 100/120 V, 220 V or 240 V. Power burden: 27 VA. Power input; 3-wire IEC connector. (Uses standard IEC cords). With 2 sets spare pens, 2 boxes charts, a few spare parts, carrying case; Used, very good condition; $100.

UNIVERSAL IEC LINE CORD SET. Each 6-foot line cord has a standard female 3-wire IEC connector at one end, and a male connector at the other; one of each from the following list:

Australia 3-pin w/ground male pin
Denmark 3-pin w/ground male pin
Europe 2-pin w/ground female & strap
India/South Africa 3-pin w/ground male pin
Israel 3-pin w/ground male pin
Italy 3-pin w/ground male pin
Switzerland 3-pin w/ground male pin
United Kingdom Fused 3-pin w/ground male pin
USA/NEC/Japan (100/120V) 3-pin w/ground male pin

One of each of the known electrical connections in the world;
9 cords in carrying case, NEW: $100

EVERYTHING TO ONE ADDRESS: $1500.

Packing, shipping, etc., are included in price.
(Lower 48) Prices are in $US.

All reasonable offers will be considered.

TELEPHONE EQUIPMENT AND SUPPLIES

GTE 10A2 13-Line Key Telephone system (KTU)

Consists of: 1- GTE H-886501-95 wall cabinet
26.25" W X 17.75" H X 9.5" D
1- GTE S-418034 power supply (w/30 Hz)
1- GTE D-543840-A power cable
1- GTE H-886584-7 13-line panel w/GTE
FD-1058-BF interrupter
6- GTE WA-1400-E line card
(has music-on-hold capability)
1- GTE WA-1467-A
Music-on-hold interface card
1- GTE WA-1401-A intercom card
1- GTE S-550763 3-plug, 50 foot cable
for interconnecting H-886584-7
panel to lines and telephones
1- GTE 10A2 13-line KTS manual

General:

Compatible with touch-tone and rotary systems. Contains
6 line cards with capability for music-on-hold, music-on-hold
interface card, intercom card, full-size power supply, wall
cabinet, with interconnect cables and manual. Designed to
support up to 20 multi-line key telephones. Everything is
NEW, but has been unpacked. Never connected. Will accept
Western Electric 400-* line cards. Original cost well over
$1000.
Everything....$375.00. If you pick it up, $300.00.

FOR SALE: REVISED 6/14/97

Electronic timer assemblies and components.
All items located 10 mi NW of Philadelphia, PA.
Prices do not include shipping.

```
************************************************************
* DYNAMIC TECHNOLOGIES INC. P/N 88052002 timer assembly *
* *
* Printed circuit, single board. Digitally counts power *
* line frequency to generate four precision timed intervals *
* of 15 sec., 30 sec., 1 min., and 2 min.; also manual *
* start/stop. Accuracy: +/- 1 cycle of line frequency. *
* *
* Control; manual input via membrane switch (or equivalent). *
* User selects one of 6 options on keyboard (DTI P/N *
* 88052003) start 15 sec, start 30 sec, start 1 min, start *
* 2 min, start continuous or stop. On-board piezo loud- *
* speaker beeps for each keyboard entry. Last command *
* entered cancels previous command or command in progress. *
* *
* Power input: 120/240 V 50/60 Hz. Frequency and voltage *
* selected by jumpers on mating connector (A/MP P/N 1-480287;*
* requires up to 10 ea. A-MP P/N 60617-1 pin). Connector is *
* available from A-MP or their distributors. Grounding is *
* required for best noise immunity. *
* *
* Output: Normally Open (NO) relay closes during timed *
* period. One terminal of relay is connected to one AC line *
* terminal (pin) on the connector; other relay contact to *
* independent pin on connector. Relay contacts rated 30A *
* resistive: printed circuit designed for 5A load. External *
* varistors required for inductive loads; can be mounted on *
* mating connector. *
* *
* Timer overcurrent protection; 2 ea fuses, 2AG, 1/8 ampere *
* fast blow, (Littelfuse P/N 225.125 typical) in clips on PC *
* board. 1 set of fuses is installed on board. *
* *
* Size: PC is 4-1/2" X 6" X 1-5/8" overall. Mounting *
* centers 4" X 5-1/2". Designed to mount with four nylon *
* snap mounts, RICHCO P/N DLCBS-4-01 typical. 1800 available;*
* 2 membrane switches included with each timer. 104 timers *
* per carton; shipping weight: approximately 60 lb/ctn. *
* 1; $10.00 w/shipping and schematic. *
```

```
* *
* All 1800: $3000. (reproducible drawings included) *
* *
* 1000 extra membrane switches available @ $100.00/lot *
* *
* 2AG-1/8A fast blow fuses, Littelfuse P/N 225.125. *
* 5800 available in original packing. $65 per 1000, *
* $300 all. *
* *
* NYLON snap-in printed circuit mounts; RICHCO P/N *
* DLCBS-4-01, Snaps into .156" hole at each end; *
* 1/4" spacer between. in bags of 1000. 25 bags available. *
* $20/bag; $400/lot *
* *
* Circuit breaker, Potter-Brumfield P/N W28X1A-5, 5 Ampere; *
* in original factory cartons (600/ctn). 4500 available *

Hi,
I'm looking for a keyer to put in my latest 8mm film can rig. Something ala
the Curtis chip (are these still availible?) I don't really need memories, or
freq read out, but it does need to be small. Suggestions?
Tnx es 72

From: "Lane C. Zeitler" <km3g@cts.com>
Message-ID: <01bc84c4$5e3c5540$b39ed8cc@km3g.cts.com>
Source record: 92854

I have contacted Eimac but the spec sheets have not arrived yet. What is the max. plate voltage for the 3CX1200A7? What are the differences btwn the A7- D7 - Z7?
I am building an hf amp but using an older ps I built a few years ago. It runs 6800vdc at about 1 amp ccs and don't know if this is too much for these tubes. It worked flawless with a 4-1000 in g.g. i built a while back.

Any specs or experiences with the 3CX1200 series tubes would be appreciated.

Sure, a keyed audio signal into a SSB rig should be indistinguishable
from ordinary CW. We do FSK that way by putting an AFSK signal
into the microphone jack. We couldn't call the emission MCW then,
though. It would just be ordinary CW generated a different way.

But if you did that with an AM or FM transmitter, not only would you
use a lot of bandwidth (not serious in itself) but the continous carrier
would be using excessive transponder downlink power. That's the
real issue.

>The problem comes with what is probably being suggested ['haven't

>causing serious interference?

Your suggestion of *keying* an FM transmitter is a quick, easy, and
cheap way to get going. Any old UHF FM transmitter will do for mode
B birds, or a VHF-Hi version will do for mode A. I like the GE Exec II,
but a Motorola or even an old ham rig will work. Don't use PTT for keying.
That's usually ugly and slow. Key a low level stage after the oscillator.

This works dandy, and is easy to do. Surplus commercial FM rigs
can be bought for $50 or less and run 80 to 110 watts. Makes a nice
signal on the bird. (Disable the modulator.)

You can convert an Exec II to VXO control by simply inserting a 0 to 10 volt
tuning voltage via a pot into the temperature compensation pin of the channel
element. this can give you about +/- 20 kHz tuning on 70 cm, somewhat less
on 2m. This also works on receive for doppler tracking if you're using the radio
as a FM rig for a digital microsat. These commerical rigs are pretty easy to
get to work properly at 9600 baud too.

The cheapest route to SSB that I know is to use an old SSB CB with a
transverter. Almost all of them can be easily modified to allow the clarifier
to swing transmit as well as receive, so you won't have holes between
the channels where you can't work. You can convert the CB to 10m if
you like, but it's usually easier to just change the crystal in the transverter
so it'll expect a 27 MHz IF. Fleamarket SSB CBs go for between $20 and
$50. A good transverter is going to cost $150 or so at a hamfest. So you're
looking at about $200 if you go that route. You might find a used IC-211 for
that much, so that's another alternative.

There's also Rick Campbell's T2. That's a very simple SSB phasing exciter
(kit available from Kanga). It can be built to work on 2m or 70 cm (actually
anywhere between 500 kHz and 500 MHz). Output is only 10 mW though,
so you'll need some serious amplifiers behind it. You can get to 3 watts with
a Mitsubishi brick (RF Parts) and follow that with an amplifer designed to be
driven by a HT (Mirage, etc). That'll probably drive the cost above the options
listed above. There's a companion R2 receiver you might want to check out,
though. It works pretty good, but you'll want a preamp in front of it. You have
to supply the LO for either of these rigs. That can be just a VXO, or if you
want to get fancy, a DDS such as the one featured recently in QST.

Antennas can be cheap too. A length of wooden 2x2 and some aluminum
clothesline wire for elements will give you a dandy CP yagi for under $10.

There's lots of ways to put a signal to the birds. You don't have to spend
thousands to get setup to do it.

I have had really good luck with Micor 110watt PA for amp. I used the realys form the Micor as tx/rx, 12vdc is easy to hook up red+ blk-, 1/2watt drive.

Here is the big question. Up till this point I have been using this puppy to turn my ht into a hp/ht. That is great for being the FM big dog. What I would like to do is use it on SSB so maybe I can be hear A grid or two away.

Will I have any luck using it the way that it is, or will I have to do major surgury?

Also what can I do to bypas the Exciter stage of the PA so I won't have to attenuate the input?

Any help is appriciated.
Thanks for reading this post.

I would recommend the TiCK-2 keyer from Embedded Research. It is in a 8 pin dip package, has sidetone out, and all adjustments are done digitally via the keyer. This includes adjusting the speed. The price for just the chip is $5.00 and is a great deal. I built one into a 20M CW rig and love it. It includes a "tune" ability and also a "straight key" and more!

The URL for Embedded Research is:

No contest..the "Tick II" keyer from imbeded technologies as is used in
the popular NorCal 38 Special. New version is cheap('bout $10),
surface mount(small) and even has a 25 char. memory for contests. The
origional Tick is also available also small, cheap(er even) from same
folks.

## 758. Diodes for detection i SWR meters?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-30 00:00:00 UTC
From: lassie <arvid@plea.se>
Message-ID: <33B7EBE0.40AE@plea.se>
Source record: 92868

Hello.
My next project is a SWR meter working well over
432 Mhz. The mechanics seems possible to make, keeping
a good 50 ohm thru-line, but what detector diodes should be
suitable? Old GE-diodes, like OA90 or AA119 can be found in
some schematics, but are there any more modern alternatives?
Schottky or hot-carrier diodes?
What diodes are used in commercial professional SWR meters?
Some strange HP ones?
Grateful for any help

MF-

Twenty years ago, I picked up a Viking Ranger (original version with 27 MHz and NO grid-blocked keying), that had apparently been wired from a kit. I also had a difficult time renovating it. I had the manual at the time, but don't recall having the assembly instructions. They may have been two separate documents.

To the best of my knowledge, the Ranger II (new version with 50 MHz) did NOT come in kit form. If you find someone with the older assembly instructions, it would certainly help. But, your friend should be aware that there are some differences.

>discrepancies between the claimed db gain of manufactured antennas and
>the db gain that was measured on the antenna range. If you guessed that
>the measured gain was consistenly lower than manufacturers' claimed gain,
>congrats.

To be expected. But why doesn't the ARRL publish the results in QST? Perhaps some day, we will all see that, say, Cushcraft's claimed gains are *always* 3 dB high, and Tonna's are spot on, say. This might cause one or the other company to change their advertising to conform to reality - unless they spend too much on advertising, of course. Another thing is that maybe one company states what they think is their antenna's gain, dBd, in free space, while another states antenna+ground gain, at optimum height and takeoff angle, vs. an isotropic in free space. And, SURPRISE! get substantially "better" gains.

--> IMO the ARRL is in a unique position to dictate a standard but instead they not only say nothing, they forbid others to say anything. <--

>Since there is no antenna range in Newington, accepting antenna
>manufacturers' claimed gain seems to be the only way this might be
>changed. However, accepting such would be like having a fishing contest
>where each fisherman is required to report the size of the fish he
>caught, instead of bringing the fish in to be measured by a panel of
>judges.

What do they need a range for? They put up one on a tower, take field strength readings from a few different locations as the thing is swept around 360 degrees, then they put up another one - say, a dipole - or maybe a competitor, and then take field strength measurements again. Present the data, and that's that. This would be especially helpfull with mobile antennas, which are small so (1) it wouldn't be a lot of work, and (2) performance is expected to be poor-ish.

>It seems to me that no db claims in antenna ads is one of the things that
>QST has right.

So, you are basically advocating censorship in a technical, "scientific"
magazine. What other things should be censored? Amplifier powers?
Feedline losses?

I completely disagree. They saw fit to mention that one amp maxed out at
1480 watts - a whopping 0.13 dBs down from the leagal limit. And they
don't even MENTION the antenna performance of the HTs in the product
reviews. Now, do you think they might vary by more than 0.13 dB? If so,
then why don't they say so? Why, they could even measure the radiation
efficiency thermally, but putting each one in a styrofoam cooler, pumping
in a bunch of power, and measuring the reflected power and temperature
rise - with no guessing about the pattern or anything. But they don't do
that either.

IMO this is a disservice to the amateur community.

I repeat; how could this be changed?

Bruce Tiemann

# 763. Re: "HOT" Chassis to Ground

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-30 00:00:00 UTC
From: Bryan <ks4hr@injersey.com>
Message-ID: <01bc859d$e447c640$6d3b8bce@bryan>
Source record: 92873
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Thare are two things that cause that. First is the leakage of a cap from AC input to the chassis, another leakage can be within the power transformer. With 2 wire plugs you can try reversing it in the socket, it will get worse or better depending on where the leakage is since one side of your 120 is "ground" and the other 120 above it.

I have a flouresent light fixture with a leak, if I touch it and the grounded equipment at the same time I get a little "tingle". Not enough to worry about but about 20 VAC..

# 764. CAROLINA WINDOM & HF ANTENNAS

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-30 00:00:00 UTC
From: jorgegc@mundivia.es
Message-ID: <33b8226e.2167511@noticias.ibernet.es>
Source record: 92874
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.homebrew

Dear friends:
Through the last months I have been reading a lot about antennas over here, so people seem to be interested and keen on experimenting with antennas.
One of my questions could be about the Carolina Windom antenna by Radioworks. I own a windom antenna made by myself with a 6.1 balum and 41 metres of wire off centre fed with coax. It is pointing North, and is about 5 metres over the roof of my 14 storeys (floors) building, and I am still wondering if I could say that the antenna performance is at 5 or if I should say at 49 metres over the ground... I wonder if there are too many differences between the Carolina and the windom made by myself. I know the Carolina has a kind of vertical radiator but, Is it any interesting???
I have worked this year Taiwan, Chagos, Tunez, Lybia, Guinea, Santo Tom�, Belice, Santa Helena, Japan, USA, Africa, all Europe and with some success in almost every pile-up (considering that I hear the Dx, of course). I have tried a 1/4w vertical for 17 metres put at 1 metre over the roof with 3 counterpoise radials and the windom dipole seems to be better than the monoband vertical (both testing in the 17 metres band, of course). Only from time to time when working the USA the vertical is performing similar to the windom. I wonder if the vertical would improve if elevated to say 3 metres over the roof or if putting 2 or 3 radials more.
I am very satisfied with the windom�s performance, as the propagation is not very good nowdays, so maybe will be improving through the months, BUT as I have been always keen about vertical, Will someone explain me why the windom is out performing the monoband vertical?
What I want to do most is DX.

# 765. ICOM 706 PROBLEMS !!!!

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-06-30 00:00:00 UTC
From: jorgegc@mundivia.es
Message-ID: <33b9229d.2214500@noticias.ibernet.es>
Source record: 92875
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.homebrew

Dear friends:
I have recently sent a message telling my problems with the 706. I had the HF section not working, neither transmitting nor receiving, though the VHF section was working OK. This happened one day while I was tunning the antenna.
I have got several answers from different countries but mostly from USA and Europe (Thanks!) and though I am still not sure about my problem, it seems that I am not the only one who has suffered this problem...
As mine is not under warranty as it is 15 monhs old (though I have not used more than 20 times) I will have to pay some hundred Usa $ dollars to the technical repair service in Spain for having the 706 repaired.
But this is not the only problem. Some people have told me also that the VHF section can be damaged if the HF and theVHF antennas are very closed.
I wish I could have an Email from ICOM America or ICOM Japan with an explanation to all this.
Also people had improved the VHF reception (very poor!) with some modiffications passed via packet or internet.
Now ICOM is back again with a new version of the 706...What problems will remain? Which ones have been solved and which ones not?

Please if you are or have been a 706 user write me back with your experiences, comments, improvements, mods, etc.

jorgegc@mundivia.es wrote:
> I know the Carolina has a kind of vertical radiator
> but, Is it any interesting???

Hi Jorge, it is interesting because it is more like the original Windom than yours is. The original Windom had some vertical radiation that helped out on 80m and 40m for low antennas.

> Will someone
> explain me why the windom is out performing the monoband vertical?

Your vertical needs many more radials but at that height, don't expect it to be as good as the Windom. A well-designed vertical will outperform a low horizontal antenna, but not a high one, at least not in the direction of maximum gain for the horizontal.

There are directions where the vertical will beat the socks off the Windom and there are directions where the Windom will beat the socks off the vertical. Such is the normal difference between vertical monopoles and horizontal dipoles.

Source record: 92880

Help, can anyone suggest a way to run a computer off of 12V battery power. I have a remote location with unreliable 120VAC. What I want to do is trickle charge a car battery, and let the computer continue to run in the event of a power failure.

What would be ideal is a computer power supply that takes 12VDC as its input instead of 120VAC.

Any suggestions would be appreciated.

Cc to kd6lor1@home.com

The Micor PA is a class-C amplifier, class-C amplifiers are non-linear.
You need a linear amplifier for SSB. You *can* convert some class-C
amplifiers into reasonable class-AB (linear) amplifiers, but this is
not something I'd even attempt with the older Micor PA.

: a good 50 ohm thru-line, but what detector diodes should be
: suitable? Old GE-diodes, like OA90 or AA119 can be found in
: some schematics, but are there any more modern alternatives?
: Schottky or hot-carrier diodes?

There's an HP Schottky "zero-bias video detector" diode in
an SOT-23 case that's intended for use in inexpensive,
high-volume applications. I got some samples and have
been using them up to 440...they should go much higher
with no problem. The number is HSMS-2850. I'm sure
there are many other Schottky detector diodes that would
work well in that sort of application. In my application,
I'm detecting RF down to sub-millivolt levels with them.

Welcome,

Chair-Pak is a great idea!!!

It's a Backpack AND a built-in Chair!!!

See it at http://www.chairpak.com

3 Sizes Full Pak, Day Pak, and a Child Pak!

How many times have you gone somewhere and needed a chair ?
beach waiting in line with friends
hiking around the campfire conventions
air shows at the park in line at the DMV
outdoor concerts hiking trails car shows
camping on campus reading at the poo l /beach
fishing trekking rest areas
poetry readings jams outdoor games
outdoor sport events story telling to children picnics
theme parks national parks hunting
backyard outdoor weddings and anywhere you want to SIT!!!

Carry your stuff and your chair where ever you go!!!

Where do you want to sit today?

Chair-Pak is made of the strong durable Dupont Cordura and the frame is of strong and light T6 aluminum.

If you would like to order, or get more information about Chair-Pak, please visit our web site

## 788. output impedance of class c amp???

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-01 00:00:00 UTC
From: yaesutom@aol.com
Message-ID: <19970701180100.OAA06429@ladder02.news.aol.com>
Source record: 92898

Does anyone know how to calculate the output impedance of a class C 1 transistor amplifier? I have a homebrew AM tx for shortwave that uses an old 2SC2314 (i think) driver transistor out of an old CB for the output. It is a class C amplifier with an RF choke on the collector going to +12V for power, then a .01uF cap on collector for the RF output. With no matching network/filter, I can get about 1watt carrier into a 50 ohm load. It sound great, but it's full of harmonics because its just the output of a class C amplifier. I need to make a pi network to filter out harmonics, but I don't know what the output impedance of the transistor is. I have a book that has a formula, but one of the things you need to know is what power output you need out of the amp. What if the power output is changing (AM, SSB, or whatever)?

Have you considered using a laptop? Even a 'big' laptop, if that's
the kind of 'horsepower' you need?

Most run and charge off some sort of wall-module -- most wall modules
for laptops seem to be 9v and most battery packs seem to be 7.2vdc --
at least on the older, affordable models. Float a car battery from a
charger off the mains -- float the laptop of the battery with a
12.6v-to-9v lm309/7809 regulator and you should be reliably 7x24.

this is a homebrew newsgroup.

build it, measure it, modify it!

Jim

There is some really good shareware on this very topic. look for it at
the ARRL. (American Radio Relay League)

# 795. Comb Generator versus Marker Generator

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-01 00:00:00 UTC
From: af389@lafn.ORG
Message-ID: <33B96BB2.10E5@lafn.org>
Source record: 92905

Hi,

I am working on a homebrew Spectrum analyser and need to
produce some markers at known frequencies.

My question is what is the easiest or best way to produce a series of
known frequency markers from 10 mhz to above 900 mhz?
I want to generate 25mhz markers and harmonics or 50 mhz and harmonics
or
100 mhz and harmonics to bracket a signal.

Is a Comb Generator ckt useful for producing known frequency markers?
If Comb is useful for markers, where can I obtain design info or who
sells it as a kit? I'd rather build my own.

At the moment, I am just using a 48 mhz TTL oscillator, in a
DIP 4 pin package, and looking at the blips from 48 mhz fundamental
and it's harmonics. There seem to not be many higher order harmonics
even though output is fast switching TTL. Highest I see is just under
150 mhz and amplitude is very small. Adding a 12 inch long clip lead is
the
only way I can seem to make the 48 mhz output radiate harmonics.

Thanks for any hints or pointers.

73, W6MIK

^^^^^^^^^^^^^^^^

quite true, after reading the inflated claims of gains in other mags and
then going out on an antenna testing range and having the opportunity to
see the real world figures for the antennae in question I for one have to
agree with the QST practice. The inflated gains listed in the ads are
from the heart of Madison Ave. (for those of you who do not know where
that is check with advertising writers and they will tell you) The
antenna manufacturers learned well from the old CB market as to how to
sell the most antennas. All they had to do was list a higher gain figure
than the competitor and they out sold them to the tune of mega-bucks.
Just ask any sales manager from the old antenna specialists company how
that jingle of the coins in the cash register went.

>
> Roy Lewallen, W7EL
>
>

Well, I guess I can get on the old soap box too. But remember this, each antenna works a little bit and some times a whole lot differant in each case, All dependant upon the surrounding environment and its' effect on it.

Hi, Paul,

The monitor will be the big problem. The computer uses 12vdc, 5vdc and -5vdc, so these would be easy to provide from batteries. No such luck on the standard monitors -- which are also the big power hogs. A lap top with its LCD (or other) display makes more sense.

An inverter for the monitor power would certainly work if you can live with the large energy requirements.

Good luck,
John, KB8MU

Hi Fred--

What you say is very true--and the same flap is going on right now over antenna tuner power ratings.

The ARRL is in a unique position to assert leadership in the area of technical standards--and to provide its members with a healthy dose of consumer education. Unfortunately, to date, their philosophy has been more to bully manufacturers (as bad guys) rather than to pro-actively establish uniformly-acceptable standards for testing and rating products within the industry.
Case in point--instead of setting up a range in Newington and developing comprehensive procedures for testing antennas using accepted practices, they simply (and punitively) banned gain figures from ads altogether. For tuners, the League at least attempted testing--using a technical resource outside the organization. However, the measurement technique was unverified, the loss results were inaccurate, and the results were published as gosprel in a product review format designed to make at least some manufacturers look quite bad. Once again, the approach was to play "gotcha" with the industry--rather than to assert positive leadership in the area of education and standards.

There's little doubt that ad departements within the ham radio industry deserve a measure of criticism for making marginal-to-outrageous product claims. But, when the customer is educated and the technical standards for product rating are well-defined within the industry, manufacturers no longer have the option of exagerating performance and justifying it by saying, "Everyone else is doing it, so I must, too".

This is the caliber of representation and leadership I'd expect the ARRL to exert upon our hobby--and I think the present leadership recognizes the need for it. However, to quote an old saw, when it comes to effecting change, suction works far better than pressure!

> > here goes: does anyone have any leads for a small device that could be
> > attached to a pet's collar to transmit a signal that could then be used
> > to find it if it gets away from the yard?

This sounds like a discussion I was having with several of my ham radio buddies.
One of them used to work in a job where he was tracking the movements of wild
animals (bears, raccoons, etc.). Unfortunately, he couldn't get me the specs on
the telemetry transmitters they use for this work; I really would like to know
how these devices are mechanically constructed to survive the wild animal's
desire to get that <censored> thing off!

This topic is of interest to me, because my Number One cat would occasionally
decide to wander off and not come back for a day or so; when he did come back,
he (of course) pretended to be starving, although he sure didn't look it. My
guess is that he was mooching off somebody up the road, but I never did find
where he would disappear to. BTW, the cat is still around, although he hasn't
disappeared lately; maybe his food providers up the road moved? :-) And yes, the
cat is neutered; I'm not adding to the feral cat problem by letting him out
to hunt.

There are plenty of ham radio books that explain the receiving end of radio
direction finding, but there seems to be a great dearth of design information
on hidden/portable/rugged beacon transmitters. Any hams got any good ideas on
this problem?

> > I have tried these cheap 'child beepers', but they work on the principal

> > is coming from (up to 1/2 mile). This sounds promising, but I still
> > have my doubts that it would even be 'directional' enough to be
> > useful.

Darren: Where did you see that article/ad about the transmitter? Was the transmitter designed to be attached to an animal? If so, I'd be very interested in reading the article. And, as I'm sure many hams will back me up on, such a set-up _can_ be directional enough to find the transmitter; "fox-hunting" (as it's called in the ham radio community) is a common competition event.

The replacement is a 1N2637, spec is prv=3D10KV @ 250 ma. It has a 4 pin
tube-type base and the diodes are mounted inside of an epoxied
cylindrical assy with a plate cap on top. You can probably find these
at a ham fest for several dollars.

debey@deltabeta.com writes:
>Is it possible to use a large capacitor as a UPS?

Practically, no.

>If I have a 1.0 farad capacitor and a PC that draws 5 amps at 5 volts
>how long would the voltage stay above 4.65 volts?
>
>Is there a formula for calculating this type of thing?

Of course. A current of 1 amp causes the voltage across a 1 Farad capacitor
to change by 1 volt/sec. So if your capacitor is initially charged to
5.0 V, it would take 350 ms for the voltage to drop 350 mV to 4.65 V
with a 1 A discharge rate. At 5 A discharge, it would take only 70 ms
for the voltage to drop to that level.

Not very useful, eh? That's why people use batteries - they store
*far* more energy than a capacitor for their size and weight.

Dave

Source record: 92776

Hi Folks,

I have available for sale an extremely well built high power AM transmitter that covers 160 thru 10 meters. Final is a 4CX1500A modulated by a pair of 3CX1200A7's using 5KW broadcast iron. Fully metered, vacuum variables with turns counters, extra final tube, all machining professionally done. Plate power supply not included, needs 3500VDC at up to 1.5 amps, depending on the desired output power. All other supplies built in. Requires about a total of 26" of 19" rack space, plus room for the modulation transformer, reactor and plate supply. It can run very conservativly at 375 watts out...up to....well look up the final tube. Priced at around $1.00 a watt at full output. Due to weight it is pick up only in Bolton, MA. 30 miles west of Boston.

Need room for the next rig under construction.

Chuck...K1KW

Yep, there is: dv/dt = I/C
so 5A/1F = 5volts/second. So you'd drop half a volt in .1 seconds.
So you'd need a LOT more capacitance.

>So you'd need a LOT more capacitance.

Any real capacitor also has a finite internal resistance, so the voltage would also drop I * R, or 5 * R in this case, where R is the capacitor's internal resistance.

You may be tempted to try using some of the small extremely high-value capacitors used for RAM backup and the like. These have a very high internal resistance, so wouldn't be usable.

Any capacitor large enough to do the job would be absolutely huge. A battery is a much more practical choice. That's why commercial UPSs all use them.

Dear Internet user,

If you are paying for your Internet services then
you have not heard about 1stFamily. We have
a marketing method that guarantees you will not
have to pay one dollar to access the Internet.

* You will never again have a busy signal !

* You will always have the fastest access you have ever seen !

* Residual income for the rest of your life !

* and much much more.

This opportunity is for YOU to take advantage of !

Do you wish to continue the rest of your life paying
$19.95/month to access the Internet when you can
access it for free with speed and reliability that exceeds
the other competitors ??? We did not think so. That
is why our company is the best and fastest growing
of it's kind and will soon compete with AT&T and MCI
and all the big companies in providing Internet Service.

For complete information please mailto:sameer@1stfamily.com
and type "More Info" in the subject box.

You will receive our webpage address where you can get enrolled in
seconds !!

There are a number of inexpensive 12v to 120v inverters on the market today. You will find them in the automotive section at Walmart or KMart. They are generally sold so that you can run AC devices on a car/boat...like TVs or computers.

>If I have a 1.0 farad capacitor and a PC that draws 5 amps at 5 volts
>how long would the voltage stay above 4.65 volts?
>Is there a formula for calculating this type of thing?

Only for a very short period of time.

The formula is V(t)=E*(1-(1-e^(-t/R*C)))
where E is the voltage you charged the cap to (5 volts in this case)
e is the base of natural logarithms, 2.718
t is time in seconds
R is the resistance of the load, in this case 1 ohm. (5 volts
divided by 5 amps)
C is the capacitance of the capacitor

If I remember my algebra properly, the voltage would remain above
4.65V for 0.6575 second.

HOWEVER-- that assumes the 1.0 farad capacitor has zero internal
resistance. That is most assuredly NOT a valid assumption. In fact,
if this resistance is more than 0.07 ohm, the voltage under load will
NEVER be greater than 4.65V. (unless you charge the capacitor to more
than 5V to begin with. However, the internal resistance is on the
order of 30 ohms according to the Digi-Key catalog, so you'd have to
charge it to 155 volts - well beyond the 5.5 volt rating.)

These caps are designed to back up CMOS RAM chips, which draw
virtually no current when their logic states aren't changing.

Source record: 92906

Greetings,

I have recently made available the N9IPV Spectrum Analyzer for the
Yaesu FT757 style rigs.
I would like to extend the same software for owners of the following
rigs...
Yaesu FT 747 style
Yaesu FT 767 style
Yaesu 980 style

Since I do not own any of the above rigs, I cannot do this unless an
owner of each of the following rigs will come forward and send me a
copy of the page(s) in your manual that describe the communication
protocol and a diagram of the front panel.

In return, I will give you a copy of the completed software.

E-Mail me for my address please. dthimm@newnorth.net

If you would like to see the features included in the FT757 version,
please visit my website and download a copy of the software at:

http://www.newnorth.net/~dthimm

Thank You and 73
Dan T.

The 2N3565 has a low noise figure, but only under a narrow range of conditions of collector current and collector-emitter voltage. I used one in my original "Optimized" transceiver in a common-base AF preamp running 0.5 mA of collector current. Some time later I discovered that a 2N3904, 2N2222, or nearly any other modern small-signal transistor would give a noice figure several dB better in that particular circuit.

I suggest using something like a 2N3904. After the rig is built, see if the noise level from the receiver increases when you connect the antenna and decreases when you disconnect it. If it does, the noise figure is adequate and improving it won't improve performance. (The most severe test would be with the simplest antenna you intend to use and when the band is quietest, like 40 meters in the daytime.)

If you can't get pukka 2N3565s, why not try for an NTE
equivalent? Or try a more readily available NPN transistor
and see if it works?

Remember too that, good as it is, Solid State Design was
published 20 years ago, and a lot of technology has happened
since then. I favour NE5532 and similar (e.g. LMC662 - yum!)
op amps for receiver audio strips these days...

> Would it be adviseable to put a JFET AF AMP ahead of the
> two bipolar transistors?

Depends on why you think you need it. The JFET amp will present
a very high input impedance, and give some additional gain.
Is this in fact what you need?

Ummmm The LMC662 is very nice for extremely low input bias current,
but for low noise?? If the source impedance is low, it seems like
it would be a rather poor choice, with _typical_ input-referred
voltage noise of 22nV/rtHz. That's more than 5 times what the NE5532
is, if I recall correctly. If the application is a very low
source impedance, as I suspect it may be, then there are a couple
op amps which are ideally suited to achieving low noise. I
particularly like the Analog Devices AD797, which in addition to
typical input-referred noise voltage under 1nV/rtHz, also is
capable of distortion products in the -140dBC range in modest
gain situations. I've also found that modern 2N2222's achieve
even lower voltage noise than this, and are a bit better than
2N3904's, but both are remarkably good for 50 to 200 ohm
source impedances.

(Laura: Where can I find LMC662's with about 0.01uV/C input offset
tempco?? :-)

Oh come on! Do we need Bill Gates to tell us how to press ctrl/alt/del?
To find the residual capacitance. Find how much capacitance is required
for a sample resonance with the coil in question. Say that is 10 MHz with
200 pf. Now resonant the coil at half that frequency. Place both those
capacitance values on a piece of graph paper and draw the line to zero
frequency. Now read off the remaining capacitance and that is the
distributed value you are looking for.. Cliff K7RR

Use generic cadd for the pcb layout.
there are many places where you can get a silkscreen made on the
internet. usually around $40.
hope this points you in the right direction

Message-ID: <Pine.SUN.3.95L.970703225754.26250A-100000@konichiwa.cc.columbia.edu>
Source record: 92718

It would be very helpful to nave a set of modules which demonstrate the basic functional blocks of a transceiver. The problem with modern radios is that it is very difficult to check their functions from stage to stage. Does such a set of modules exist and or would anyone be interested in developing them?

Subject: Free Service That Will Save You $1,000s

Hi!

I am an authorized distributor for some very special software that I can give to homeowners absolutely free.

This software provides you, the homeowner, with a FREE service that allows you to...

Save Thousands Of Dollars Without Refinancing!

Cut Years Off Your Mortgage Without Increasing Your Payments!

Build Equity In Your Home 300% Faster!

Turn Your Current Mortgage Into An Investment Program!

Audit Their Loan Automatically To Find Lender Mistakes Which Occur About 50% Of The Time According To The F.D.I.C.!

And the Software is FREE - Nothing For You To Purchase!

The software takes the you through a full presentation and explains everything to you.

If you are interested in using this free software, please visit my Web Page at:

http://members.aol.com/homeown

This is truly a wonderful program and one that I'm using to save thousands of dollars for my family and friends.

Sincerely,

Kim E. Inman

PS. Please feel free to pass this information on to your family and friends.

I read that such a transceiver for HF was demonstrated at the Dayton Hamfest but I can't remember the manufacturer. Kantronics maybe? The article mentioned that a couple of other manufacturers were working on similar transceivers. I've thought about this a little myself. It would greatly simplify the interface electronics and allow all sorts of neat additional features in software. I don't think it will work to do the DSP stuff in software, though -- too slow, although the PC would control the DSP chip. I also came to the conclusion that the easiest way to deal with the RF shielding problems is to use a separate box for the radio set at some distance from the PC and connected to it by a long serial cable. Cables for the microphone, speaker, and key would be bundled with the serial cable (you might be able to use unused pins of the serial cable for all but the microphone which needs to be shielded).

Then you design for the peak envelope power condition, and let the
cards fall as they may at lower power levels.

This is the main reason why AM linear amplifiers have increased
efficiency during modulation crests.

>self-resonance) of a multi-layer coil, based on the geometry? Thanks.
>
> --- mkj

Hi MKJ.

The actual calculation is VERY complex, and is best solved by direct
measurement.

I or others can probably describe several ways to measure the effect
you need to know.

I probably still have a thirty or forty page paper written by WP
Czerwinski, and excerpts of his paper were printed in Electronics,
August 26, 1960. I'm sure you could obtain a copy from a technical
library.

Every modeling program I've tried produces VERY inflated inductor Q's,
and incorrect self-resonant frequencies. I'm not sure they work at all
with multilayer inductors.

Many VERY subtle effects modify the effective layer to layer
capacitance, so I think you'll be unhappy with the results of any
estimate or modelling program unless you are willing to accept more
than two to one error. Even the calculations of single layer solenoids
are almost impossible to make, and are not modeled accurately (at
least with all the programs I've seen).

So as much as people may want to help you, there may be no good answer
except cut and try.

Yep, I agree, and that's assuming you have an ideal 1 farad
capacitor (no internal resistance). Preformance will be less.

Chuck

The 1F 5V cap is particularly non-interesting. I doubt it could output that current
in any case.

Watch what happens though:

If it's line powered, then we can assume the switcher runs from about 140+ volts.
In a cap, energy stored = .5*C*V^2, so at 5V 1F stores 2.5 Joules, assuming you
can get them all out, which you can't.. Actually, I believe the only charge you can
recover is .5 * C * (5 - 4.65)^2 which is 0.061 joules.

If you have 10,000uF at 140 volts, then you have 98 joules stored total, and you
should be able to use it down to say 70 volts or so, which would indicate about
24 joules deliverable. Your load is 24 joules, so barring switcher efficiency, you've
got a one second "micro-ups" which will get you through glitches and momentary
outages, instead of a 70mS (very debatable!) figure.

You may have more voltage in the switcher primary, in which case a given case
size should store about twice the energy if the voltage is closer to 300V (doubler
input), and you should gain even more from the interval till the switcher shuts
down.

I use this technique on lower powered systems exactly for this reason. A larger
cap on the input that is strictly necessary allows me to bridge short outages
for cheap.

Yea, one of the other subtle differences is that the grid lead in the Z7 is the only one with short leads and thereby a whale of a lot easier to tame at the higher frequencies! I think everyone that used the other versions had difficulty getting the grid to ground at 10 meters.

Stan King W4KR ex-W8POZ SCAM ARTIST

I need any information on the present whereabouts of Stan King, callsign W4KR (ex-W8POZ). He left many hams in southeastern Michigan holding the bag for many thousands of dollars in an elaborate scam.

In spite of a court order (relating to these frauds) to keep his current address on file with the court in Ann Arbor, Michigan, he skipped the state in late 1996. His current W4KR license address shows a "dead-end" mail drop in Florida, and his driver's license was changed to Texas with a false address.

If you know where this crook is, please email me with the information. Any tip, no matter how small, is helpful.

73, and thank you very much.

Sure, if we spend enough money we can measure certain antennas--I'd like to
have a microwave test range to measure high gain 10 and 24 GHz antennas :-)

However, as the gain and frequency goes down to the kinds of antennas
amateurs really want to know about, I seriously doubt that a realistic
margin of error is achievable. A couple dB of error isn't unusual.

The measurement technique for antenna tuners was published in the April
and May 1995 issues of QST. How long should we wait for people to comment?

We tried a more direct approach with phase noise--I sent out letters
to the manufacturers describing our technique and received silence
in return. Of course, I needed to send out duplicates to at least
two manufacturers after we published our first set of reviews...

I'm absolutely with Roy on this one:

*DESIGN IT FIRST* and then "build it, measure it, modify it"

... which is actually what the original questioner wanted to do.

>>How sad for amateur radio.
>
>That's why we're referred to as "amateurs." The "professional radio service"
>is next door.

We're referred to as "amateurs" for a variety of reasons, including:

1. We don't get paid.

2. We don't have access to professional equipment.

3. Most of us have less time than professionals, because our full-time
job is something else.

4. Because of #1, #2 and #3, we sometimes have to cut corners.

5. We can't be bothered to think and learn how to do it right.

I can live with #1, #2, #3 and even #4 - but if "amateur radio" had to
mean #5 as well, I'd be outa here.

Fortunately there are people like Roy around to remind us that it
doesn't have to be that way.

Hi Zack--

In you post you wrote:

"The measurement technique for antenna tuners was published in the April and May 1995 issues of QST. How long should we wait for people to comment?"

Your question is well taken, but not the question I would ask. As a technical editor, I'm sure you know that the mere appearance of something in print is no automatic certification of its credibility or real-world applicability.

To answer your question, perhaps one must wait for comment until the measurement technique in question is used to generate incorrect data that damages the credibility of a major manufacturer with economic consequences. That, if nothing else, is certain to gain attention and motivate a swift response.

Rick K1BQT

Hi Zak,

I don't agree with the Leauge bashing that goes on, I think you guys do as good a job as resources allow you to do. But I suspect you'd be better off if you openly explained WHY certain things go wrong, AND took outside suggestions seriously instead of blindly trusting a few select people.

It isn't making mistakes that get us into trouble, it's not admitting the mistakes with a frank admission of why the mistake occured.

On Thu, 03 Jul 1997 06:09:03 -0400, Zack Lau <zlau@arrl.org> wrote:

>However, as the gain and frequency goes down to the kinds of antennas
>amateurs really want to know about, I seriously doubt that a realistic
>margin of error is achievable. A couple dB of error isn't unusual.

Thats exactly true. People will squak about this until time's end but it is VERY difficult to measure an antenna, especially a horizontally polarized antenna, near earth. Comparisons at one fixed weave angle are easy and reliable, but absolute gain measurements are impractical.

>The measurement technique for antenna tuners was published in the April
>and May 1995 issues of QST. How long should we wait for people to comment?

This is where we disagree. Two points:

1.) When you receive comments, they often just get referred or relayed directly to the author. Into the trash they usually go, since its the author controlling the comments. People on here have been whining about one particular case of this where despite dozens of letters, an author had a "free-hand" to publish non-sense for years. It was only after QST sent his Handbook and other material out for review and EVERY reviewer responded negatively that anything was done.

Then, instead of QST saying "we made a mistake by not properly reviewing the material", the clean up job was left to others.

2.) With the tuner measurement article, why is iit ANYONE's job to read every QST article that might potentially affect future reviews?

That is a silly suggestion in this case Zak. In my opinion any knowlegeable engineer would AVOID using something as sensitive and unreliable as VSWR reduction through loss to measure power loss in a tuner. Take a minute and run a sensitivity analysis on that method. As small an error as the one between 1.8:1 to a 1.9:1 change in SWR can produce a DOUBLING of loss!!!

Not only that, the likelihood of error changes with tuner Q, the higher operating Q tuners producing results more sensitive to human and physical limitations.

The outside person checking the tuners used a MFJ-259 to measure SWR to calculate loss, and didn't even own or use a pair of wattmeters or an RF voltmeter to verify the results

He already found a calibration error that accounted for up to a 50% error in loss estimates, but nothing has been published yet.

People don't fully appreciate how difficult it is to measure RF power with exacting results. A Bird is only + or - 5% of full scale anywhere on the scale. Even a specially calibrated element matched to ONE meter has an error range of + and - 3%. With a caloric standard we can get only half to one percent accuracy. So with a 2500 watt slug, your 1500 watts might be as low as 1375 watts or as high as 1625 watts, and with the same slug 100 watts would be a wild guess...you might as well use a light bulb.

HOW you use the instrument is often just as important as what the instrument is. A Bird should NEVER be used as an absolute power reference because true power could vary as much as 10% of the full scale reading.

If a Bird is used in a relative comparison errors could be made to cancel out leaving only scale tracking errors. Unfortunately, the few direct measurements that were made were measured using a method that ADDS the errors instead of canceling them, producing a potential delta of 20% or MORE in the end number (ie 80% efficiency might be as low as 60% or as high as 100%).

In one test, someone moved a slug from meter to meter. They claimed the slug was from a "specially calibrated" meter. But if Bird specially calibrates a slug, the slug is matched to a particular meter, and the tolerance then becomes + or - 3% for that slug in that meter. Move that slug to another meter, and the error now becomes LARGER than 5%. That's because the slug isn't in the center of the tolerance range of the meter movements and line sampling units dimensional tolerances, instead its centered on ONE particular line sampling unit and meter.

IMHO, using a MFJ 259 to measure tuner loss is like using a weight and a knotted nylon string to measure water depth on a ship. Even my $30,000 Network Analyzer has a .25 dB or 2% tolerance in measuring return loss. Using the indirect SWR reduction loss method is nearly useless with a $30,000 instrument, why would it work with a $200 SWR meter?

I can't even find a piece of 50 ohm cable that is REALLY 50 ohms. They all measure from 44 ohms to 60 ohms, and precision mil spec cable ranges from 48 to 55 ohms.

There is NO WAY VSWR can be determined close enough to use that method in the real world, unless we want to accept a 50% tolerance in loss estimates.

>We tried a more direct approach with phase noise--I sent out letters
>to the manufacturers describing our technique and received silence
>in return. Of course, I needed to send out duplicates to at least
>two manufacturers after we published our first set of reviews...

I'd appreciate it if you could send me a copy. I make measurements for Medical FDA certification as well as other less critical requirements like matching networks. I am always interested in better ways to do things.

Have you run a sensitivity analysis on your measurements?

>capacitor (no internal resistance). Preformance will be less.

Yes. In fact, if the internal resistance is greater than 0.07 ohm, then the voltage at the load will never exceed 4.65 volts unless you charge the capacitor to more then 5 volts. According to the Digi-Key catalog, the internal resistance is more like 30 ohms, though that's specified at 1KHz. I'm not too sure what the DC figure is.

$$$ Big Time Mailbox Cash $$$

A little while back, I was browsing these newsgroups, just like you are
now, and came across an article similar to this that said you could make
thousands of dollars within weeks with only an initial investment of
$5.00! So I thought, "Yeah, right, this must be a scam," but like most
of us, but I was curious, so I kept reading. Anyway, it said that you
send $1.00 to each of the 5 names and address stated in the article. You
then place your own name and address in the bottom of the list at #5,
and post the article in at least 200 newsgroups. (There are
thousands.) No catch, that was it.

You can make up to or over $50,000.00 in 4-6 weeks, maybe sooner! I
SWEAR, I'M NOT LYING TO YOU, AND THIS IS NOT A SCAM! If you're
interested in making some big bucks, keep reading; if you're not, I
apologize for wasting your time.

So after thinking it over, talking to a few people first, I figured what
have I got to lose except for 5 stamps and $5, right? One person who
very recently had tried it said it worked like a charm. He started
getting money in the mail! He was shocked! He figured it would end
soon, and didn't give it another thought. But then the money kept
coming IN - tripling in size and multiplying by 10 - 20 times the
amount that he got the first week! In his first week he had made a
total of over $1,000!!! In the third week he had over $10,000 dollars,
and it's still growing! This is his fourth week and he's made about
$42,000 Total, and believe it or not the money is still coming in...

I know this has been checked out several times with the legal community
and is deemed perfectly Legal, but being a very cautious person, I also
wanted to check it out with the US Post Office. I called them
(1-800-725-2161) and explained this process and asked if there were any
regulations that would be violated by doing this. Without hesitation,
the postal official also said it is legal. At that point, I felt
comfortable going ahead and joining the process.

Let me tell you how this works and most importantly, WHY IT
WORKS!...Also, make sure you print a copy of this article NOW, so you

get the information from it, and begin making money. The process is very simple, and it consists of 3 ease steps:

STEP 1: Get 5 separate pieces of paper and write the following on each
sheet of paper: "PLEASE PUT ME ON YOUR MAILING LIST. YOU ARE NUMBER #."

Get five $1 bills, and place ONE inside each piece of paper that you have just written on, and fold each piece of paper so the bill will not
be seen in the envelope (otherwise, nosy people who like to steal envelopes with money in it will not get yours). Put one paper inside the envelope and seal it. Do the same for all 5. You should now have 5
envelopes sealed, each having a piece of paper AND the $1 bill inside. NOTE: Make sure those words that were stated above are written on each piece of paper. What you are doing is creating a service by this. This
is PERFECTLY LEGAL. Now, mail the 5 envelopes with the paper and $1 in each to the following 5 addresses:

#1 P Gratrix
12165 Monaco Dr.
Brighton CO 80601

#2 T. Livingston
2361 Antietam Circle
Lemoore, CA 93245

#3 K. Burks
HC 01 Box 103
Keene Valley, NY 12943

#4 Paulo Aboim Pinto
Praceta 1º de Dezembro 5 c/v esquerda
2675 Odivelas / Portugal

#5 Miguel Kennedy
Avenida Nossa Senhora do Rosario Nº1042
2750-Cascais / Portugal

STEP 2: Now take the #1 name off the list that you see above, move the other names up (5 becomes 4, 4 becomes 3, etc...) and add YOUR Name as number 5 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there is close to 18,000 groups) All you
need is 200, but remember, the more you post, the more money you make!

Don't know HOW to post in the newsgroups? Well, do exactly the
following:

FOR NETSCAPE USERS,

1) Click on any newsgroup, like normal. Then click on "To
News,
which
is in the top left corner of the newsgroup page. This will bring up a
message box.

2) Fill in the SUBJECT with a flashy title, like the one I
used,
something to catch the eye!!!

3) Now go to the message part of the box and retype this
letter
exactly
as it is here, with exception of your few changes. (Remember to add
your
name to number 5 and move the rest up)

4) When you're done typing in the WHOLE letter, click on FILE
above
the
send button. Then, SAVE AS.. DO NOT SEND YOUR ARTICLE UNTIL YOU SAVE
IT. (So you don't have to type this 200 times :-)

5) Now that you have saved the letter, go ahead and send your
first
copy! (Click the SEND button in the top left corner)

6) This is where you post all 200! OK, go to ANY newsgroup
article
and
click the TO NEWS button again. Type in your flashy subject in the
SUBJECT BOX, then go to the message and place your cursor here. Now
click on ATTACHMENT which is right below the SUBJECT BOX. Click on
attach file then find your letter wherever you saved it. Click once
on
your file then click OPEN then click OK. If you did this right, you
should see your filename in the ATTACHMENT BOX and it will be
shaded.

NOW POST AWAY!!

IF YOU ARE USING INTERNET EXPLORER:

It's just as easy, holding down the left mouse button,
highlight this entire article, then press the CTRL key and C key at
the
same time to copy this article. Then print the article for your
records
to have the names of those you will be sending $1.00 to.

NEXT, Go to the newsgroups and press POST AN ARTICLE type in
your
flashy subject and click the large window below. Press CTRL and V and
the article will appear in the message window. ** BE SURE TO MAKE YOUR
ADDRESS CHANGES TO THE 5 NAMES. ** Now re-highlight the article and
re-copy it re-copy it so you have the changes.... Then all you have to
do for each newsgroup is CTRL and V and press POST. It's that easy!!

THAT'S IT! All you have to do is jump to different newsgroupes
and
post away, after you get the hang of it, it will take about 30 seconds
for each newsgroup!

** REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE
MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF
200 **

This is WHY this works!

Out of 200 postings, say I receive only 5 replies (a very low
example).
So then I made $5.00 with my name at #5 on the letter. Now, each of
the
5 persons who just sent me $1.00 make the MINIMUM 200 postings, each
with my name at #4 and only 5 persons respond to each of the original
5, that is another $25.00 for me, now those 25 each make 200 MINIMUM
posts with my name at #3 and only 5 replies each, I will bring in an
additional $125.00! Now, those 125 persons turn around and post the
MINIMUM 200 with my name at #2 and only receive 5 replies each, I will
make an additional $626.00! OK, now here is the fun part, each of
those
625 persons post a MINIMUM 200 letters with my name at #1 and they
each
only receive 5 replies, that just made me $3,125.00!!! With an
original
investment of only $5.00!

AMAZING! And, as I said 5 responses is actually VERY LOW! Average is
probable 20 to 30! So lets put those figures at just 15 responses per
person. Here is what you will make:

at #5 $15.00

at #4 $225.00

at #3 $3,375.00

at #2 $50,625.00

at #1 $759,375.00

When your name is no longer on the list, you just take the latest
posting in the newsgroups, and send out another $5.00 to names on the
list, putting your name at number 5 again. Then start posting again.
The

thing to remember is, do you realize that thousands of people all over the world are joining the Internet and reading these articles every day, JUST LIKE YOU are now!! So can you afford $5.00 and see if it

really works?? I think so - People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the Internet and newsgroups everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual Internet. Remember, play FAIRLY and HONESTLY and this will work. You just have to be honest. Make sure you print this article out RIGHT NOW, also. Try to keep a list of everyone that sends you money and always keep an eye on the newsgroups to make sure everyone is playing fairly. Remember, HONESTY IS THE BEST POLICY. You don't need to cheat the basic idea to make the money!!

GOOD LUCK to all and please play fairly and reap the huge rewards from this, which is tons of extra CASH. ** By the way, if you try to deceive people by posting the messages with your name in the list and not sending the money to the rest of the people already on the list, you will NOT get as much. Someone I talked to knew someone who did that and he only made about $150.00, and that's after seven or eight weeks! Then he sent the 5 $1.00 bills, people added him to their lists, and in 4-5 weeks he had over $10k. This is the fairest and most honest way I have ever seen to share the wealth of the world without costing anything but our time!!! You also may want to buy mailing and e-mail lists for future dollars.

Please remember to declare your extra income. Thanks once again
:)

Pretty high also. These caps are only really useful for high impedance
loads.

I missed the beginning of this thread... if the question was if a big cap
could
be used to back up a computer with a SMPS, the answer is yes. It has been
done but I forget where I read the article. Remember that the front end of
a
typical computer PS is a rectifier charging a capacitor, so many of these
units
can run off of pure DC (they already are...). The bigest problem is that
not all
power supplies will work correctly as some generate an early power fail
signal
based on the presence of the alternating input. It's not usually worth the
effort
to find this signal and disable that logic. Also some autovoltage supplies
will
trip into the 240 Volt mode and have unreliable performance.

That was my further experience in my July 1997 QEX article. I put an enormous effort and considerable cost of materials into it. I was working for no more than 10 cents an hour net profit.

>
> Professionals have plenty to offer amateur radio. People like Bill,
> myself, and many others can spread information about how some of the

Bill - don't bother with a regenerative receiver; it would be too unstable at 50 MHz. Your best bet would be a direct conversion DSB transceiver that uses a 17 MHz VXO and frequency tripler to reach 50 MHz. A 50-100 kHz pulling range should be possible on 50 MHz.

Solid State Design contains details for a suitable 6m DSB transmitter. I'd suggest though that the crystal oscillator be replaced with a VXO and tripler. A direct conversion receiver using a NE602 and FET preamp should work OK.

To: baggybob@cris.com
Subject: smd parts

baggybobs' buck a bag bargain bonanza
brought to you by bob & kim.

Surface mount parts for experimenters/prototypers
all new surplus unless otherwise noted

Shipping to the USA
Small parts orders (less than $35 usd ). I ship by priority mail. Cost is $3

Larger parts orders I will ship by UPS using an agent. Cost is $5
I ship UPS COD only upon receipt of $10 deposit. The UPS depot is 60 Km
away. I have to drive there and handle CODs myself. I cannot afford the
cost or hassle of refused COD shipments.

Really small parts orders (up to $5 surface mount parts only). Send me a
SASE with three stamps. I will put in some foam filler to prevent damage.
International orders require international money order or funds drawn upon
a US bank. We can determine together the best way to ship.
.
If you have tech questions please e-mail. I will answer in a day or two.

## 876. 5khz Receivers ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-04 00:00:00 UTC
From: Mr Deeley <esrkq@warwick.ac.uk>
Message-ID: <33BD15EC.75EB@warwick.ac.uk>
Source record: 92736

Question to knowledgeable radio people.

I bought a Heart Rate Monitor, the specs say the ecg chest strap transmits to the Watch Receiver at 5khz +- 10/%. (Transmits a short beep for every heart beat.)

1) Does this sound right ? (seems low)

2) If it is right, are there small (eg walkman type size) and inexpensive receivers which could pick up this signal.

regards,
Paul.

As a previously published author myself, I want to
thank both of you gentlemen for your efforts. I
know how much work it is and also know the warm
glow one has when his work is published.

As a recently-retired professional with thirty
years of experience in the RF measurements game, I
believe that I probably have something to offer to
the ham community to which I've belonged for 40
years and to which I own my career.

However, it is with much reluctance that I feel compelled to write about the bad experiences that have gone with the good. I do so with the hope that some in the publishing game will take note and realize that their actions can drive away some of us that may have something to offer.

Because I still entertain the idea of writing for publication in the future and I'm not trying to embarrass anybody, I will make the following brief and purposefully vague:

Item 1: Have article on speech processor published in now-defunct ham magazine. Get many requests for circuit boards from readers. Since I don't have or make boards, I contract to have some made which I sell for cost.

Editor of magazine starts kit company and offers my design as his first kit. I have to pay for ad to sell off circuit boards.

Item 2: Have article on noise blanker published in same magazine.

Some years later, friend says he sees my circuit in popular radio handbook. A short note of thanks from editor or a courtesy copy of book would have been nice. But then again, under that plan they would have to give away all of them.

Item 3: Write article on fixing birth defect in imported UHF transverter. Send to same magazine (I'm a slow learner). Article accepted for publication but no payment received.

Follow-up determines that article sent to importer of transverter for "technical review". Importer is advertiser in magazine. Article never published. Payment-upon-acceptance policy just happened to change to payment-upon-publication after article accepted.

Item 4: Read article, directed to newcomers, on different feed system for multi-band antenna in popular ham magazine. Write letter to tech editor pointing out flaws in conclusions. Exchange several letters with editor and include mathematical examples and results of modeling. Also point out errors, which have existed for years, in chart in popular radio and antenna handbooks.

My letters are never published, however, a very slightly changed version of one of my examples is published in new sub-section in revised antenna handbook. Chart which was in error also fixed. No mention ever made as to source of info.

Item 5: How it should be done. In passing, I offer only a tiny bit of advice to friends who author book on CCD camera design for amateur astronomers. They include acknowledgment in book and publisher sends letter of thanks and complementary copy of book.

Question: Should I leave ham radio and take up astronomy?

My experiences with ARRL, RF Design and Communications Quarterly have been satisfactory, but maybe things do not always happen exactly as I would prefer (that's life!).

For a retired person such as myself I would suggest that the article itself be the end product of efforts and not be followed up with any business ventures. That can very quickly take all the fun out of it and endanger the family nest egg.

## 879. Re: QST Call for Articles

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-04 00:00:00 UTC
From: the2x4@aol.com
Message-ID: <19970704175600.NAA12457@ladder01.news.aol.com>
Source record: 92739

This is not precisely following the thread:

First. I read Wayne Green's stuff. Along with personal
experience I believe QST does not take hamdon to heart.
Sure they are serious about hams but not to the point of
promoting rank and file directives as I think they should.
Agreed the directives would be enormous but heck they
have to do something up there. Majoral ideas would surely
assert themselves for publication or discussion.

Second. I just had a couple articles published in Nuts & Volts.
I choose to seek publication there because the general feel and
affect of their articles is unformal and seems to be written by
others who appear to be regular guys. QST's articles, to me, are
written by stiff necked engineers or professional people unable to
inject even the slightest hint of spontaneity, humor or relationship
to just being a good ol' boy. Because of the guidelines? Ya' got me.

Third. I am also in it for the money. Just getting published made my whole
year
but the $150 per page permits me a little time to research more articles.
I made $24
an hour on the first article. WORD keeps track of my time spent so I know
what I'm earning The last article JULY/97 issue, was faster and I earned
much more than that. Maybe I got two more articles to do, maybe.

Sure I like to help other people , not necessarily hams, with ideas or
pecular knowledge I have. I'll do it on a personal basis though.
I wish all the guys at QST felt as ya'all do and would just take care
of hamdon for the pure joy of seeing the society of hams flourish
without any gratuity at all. Until then I think I'll take the money
too.....

Carl

They call me everything in the book
Sumtimes theya call me 2x4
Sumtimes they just call me...when they need a good hand
Then they call me The Radioman

We're in the CB radio bidness!

: Can someone here please give me a quick tutorial, or point me to
: information, about how to calculate the inter-winding capacitance (and
: self-resonance) of a multi-layer coil, based on the geometry? Thanks.

: --- mkj

Well, there is one, although it is a bit old:

1. Breit, G., "The Distributed Capacity of Inductance
Coils," The Physical Review, Vol. 18, No. 2, August 1921,
pp. 133-135.

For which there is a much more extensive discussion in:

2. Breit, G., "The Distributed Capacity of Inductance
Coils," The Physical Review, Vol. 17, No. 6, June 1921,
pp. 649-677.

For multi-layer coils, I can't seem to find anything else in
files. However, if they might be of any value, here are some refer-
ences related to single-layer coils (solenoids), which may lead you
to what you're seeking:

3. Palermo, A.J., "Distributed Capacity of Single-Layer
Coils," Proceedings of the IRE, July 1934, pp. 897-905.

And, for measuring the capacitance, there is one very good
reference outlining a good technique:

4. Dunn, John, "Dual Resonance Measurements Evaluate Un-
known Coils," RF Design, October 1994, p. 54.

I gotta go.

Body handling: HTML body converted to readable text

Sorry to say. I doubt you will have much luck converting that radio to
the 440 Mhz band. The front end filter is has different coils in it vs
the 450 range I'm not sure of the turn count, but it would be to short.
there are several other components both in the rx and tx sections that
would have to be changed. The 450 range radios just bairly convert with
out component changes. My best advice is take it to a hamfest sorry
for the bad news.

What you should look at is a UPS (uninterruptible power supply).

A good UPS has what you want: a battery + regulation.
More Power and time that the battery will hold up (in case of
power fail) higher the cost. Small UPS are in the 200$ range.
The new brand of fancy UPS is even connected to your computer
and will shutdown Win95 when power is gone and battery is low.

There are tons of them. There is even a YAHOO section just on that...

>
> Is there a formula for calculating this type of thing?

Your PC power consumption seems a little bit low, you may
have forgot other voltages and power to disk drives etc..
Typical PC power supply is more in the 200W range that 25W.

A ONE farad at this power will give you a 5V/s slope and the
voltage will drop to 4.65V in ..... 70ms (MILLISECONDS)

I don't what you mean by "UPS". If it is just filtering small
milliseconds glitches in the AC line, the PC power supply will
do that. If you want to have your PC running when power is gone
or protect your PC from scrambling its Fat tables when there is
a power fail you need a real UPS with a battery inside.

I have seen huge capacitor banks (like 8 to 10 coke cans) used
in process control minicomputers and that gave you just enough
time (100 ms max) to save machine status so you will be able to
restart at the same point.

Capacitor UPS is no very usefull in PCs....

## 891. 2m/70cm anti-duplexor

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-05 00:00:00 UTC
From: jzawodny@pcocd2.intel.com
Message-ID: <5pmm1c$i8u$1@news.fm.intel.com>
Source record: 92611

Here's the question, is there a filter arrangement or some other
means to do the following... I have a Yeasu FT5100 with the duplexor built in,
but to use it for psuedo base station use, I would like to be able to
use beam antennas. They all appear (as I would expect) to be single band
models. Even the Cushcraft "dual band" appears to have two feedpoints. So,
is there an arrangement that will filter the output signal of the radio
to the appropriate antenna and also allow both bands to be received????

Thanks in advance..

jtz

>Phd too.

Hey Jimmy - I'm the KING OF RADIO. Any resemblance to Stan King's last name is a coincidence. And your logic that I am actually Stan King putting up wanted posters all over the internet to "deflect guilt" is, well, tenuous at best. I really don't understand how that works.

Vis-a-vis the "no name, no call" bit - I do not post using my identity so as to avoid hooking up personally with TOTAL ASSHOLES LIKE YOU. I used to post under my real name until I once made an innocuous comment that some guy interpreted to be "pro-code." I received a 2AM phone call at home demanding to know why I wanted to "kill the hobby." *That* was enough for me. I am a ham, Jimmy, but don't really want to get to know morons like you "up close and personal."

My post was made looking for information on finding the whereabouts of Stan King, W4KR ex-W8POZ. Any readers out there who have so much time on their hands that they want to verify the veracity of my statements may contact the Washtenaw County Circuit Court in Ann Arbor, Michigan and request a copy of the case number 94-3565-GC titled "Doty v. King."

Check out the new AES catalog. Inside the front page is an
advertisement for the PatCom transceiver. It has a serial interface for
connection to a PC, a 2.5-30mhz general coverage receiver, built in CW
keyer and RTTY decoder (and more as they say on TV).

If I am not mistaken ( I had a HTX-100 for 2 years, until it was
stolen), the radio uses a PIN diode for T/R switching. If you could
find the right part, it would be a fairly simple repair.

Hi all,

My homepage is getting bigger and will continue to do so until
Telenordia tell me I have run out of disk space on the server.
You cn find my homepage at:

http://user.tninet.se/~acz732k/

Amongst my constructional projects are:

BASIC INFO FOR BEGINNERS
How to solder
Component identification
tools

ANTENNAS
Remote tuning of tuneable antennas
Basic dipole information
Short antennas for the HF bands
A balcony/terrace antenna (worked JA on it)
Packing crate antenna
Frame antenna

RECEIVERS
Cigar box HF receiver - uses battery valves
IC HF receiver
HF direct conversion receiver
Regenerative HF receiver
HF and VHF receiver using ZN414 (ZN416)
Modifying domestic receivers for HF SSB
Modifying domestic receiver for 160 meters
Synthesized receiver

TRANSMITTERS
FM (88+108MHz) 'BUG' (can be modified for 30 MHz)
250mW HF bands CW TX
4 watt PS for the above
5 watt CW TX - dead easy to build
CW TX using voltage regulator
Single valve TX
Two valve TX
Cigar box transmitter (valve)
145MHz FM TX
QRP SSB TX
3 watt linear 1 - 30 MHz
Phasing method SSB exciter

500 watt linear amplifier
April 1st transmitter

USEFUL
VHF NBFM Crystal RX based on a coffee tin
250vDC for valves using modern components
Stereo enhancement for HF CW
CW filters
Self tuning CW filter
Q-multiplier
CW keyer using 'relay logic'

DATA/INFORMATION
QRP frequencies
Measuring micropowers
Making PCBs, several methods
G0TLAs QRP circuit database on packet
Coil winding and 'turns' calculation.

DOWNLOADING
Signal generator program
All my QRP@WW circuits in a ZIP file
PCB foil for BUG TX (later version)
'Adult' screen saver

BREWING BOOZE
Brewing beer, wine and 'mash'
Distilling the mash (3 methods)
Making liquours

----------------------- and more -----------------------

I will be adding more to the homepage constantly, as long as
I have the time available to do it.

Have fun with QRP (and QRO) de Harry, SM0VPO, Upplands V&#65533;sby.

>

Probably in between those limits. The PS rating is the MAX that the
PS can handle (and in the ratios specified).

> A ONE farad at this power will give you a 5V/s slope and the
> voltage will drop to 4.65V in ..... 70ms (MILLISECONDS)
>

You don't want to do it that way. You lose your 12V and your
negative supplies (for comm, etc).

Much better to parallel the PS bulk primary capacitors with really
huge caps if you want to try this (then you have all your PS outputs
and full regulation). BEWARE! the voltages are dangerous!

If you want to save some time just buy a Back-UPS at any decent
sized hamfest for $50.

## 903. Antenna info sites on the net???

yes, send them some long text they have to read, in a style which
causes them trouble to read and understand. Let them think that you
are interested to talk about their proiduct, so they benefit from
reading your text to learn what you are telling them.
Change text somewhat next time you use it sending it to a spammer

Perhaps someone English/American fellow could make some text we can
use to cause them so much work reading the comments that they soon or
later have to stop advertising in some newsgroups??

Message-ID: <5pnrvl$hcs$7082@roadrunner.miracle.net>
Source record: 92616

We are a New York based international photo agency representing professional and amateur photographers in search of having their work promoted in order to conduct their profession or hobby minus the time consuming inconvenience of presenting and selling their own work.
You do not have to be a professional photographer to sell your photographic work successfully, and as any pro will tell you, quite often throughout history an amateur stumbles on a scene that he or she photographs and ends up with a photo that becomes a classic. Those who publish magazines, books, newspapers, greeting cards, record albums, or just about anyone who works with images in their profession, are in desperate need of fresh material, and are more than willing to review photos submitted by professional photo representatives. Sometimes the photos of amateurs are sought after more so than professionals because of accidental originality and innovative themes.
At Photo Phoenix International, we delight in and value the work of people who view photography as a fine art and understand a photo representative's significance in terms of a photographer's career, reputation, and monetary gain.
The photos we are seeking are some of the following: ANIMALS, ARCHITECTURE, ART, AUTOMOBILES, BUSINESS, CELEBRITIES, DOCUMENTARY, ENTERTAINMENT, EROTICA/NUDITY, FASHION, FOOD, HEALTH, HISTORY, HOBBIES, OUTDOORS, PEOPLE, POLITICAL, PORTRAITS, STILL LIFES, RELIGIOUS, SCIENCE, SPORTS, TRAVEL . . .
Whether your work portrays conservative, experimental, stylish, or innovative themes, your project proposal should be well thought out before submitting to us.
For first contact, submit a query letter and "SAMPLES ONLY" of your photos.
You must include "2" self addressed, stamped envelopes--one for correspondence, the other for the return of your material should we not be interested.
If we think your work is sellable, we will respond as soon as possible. Do not send entire portfolio unless we ask for it.

# 907. Barebones Superhet @ N2CQR

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-06 00:00:00 UTC
From: wmeara@erols.com
Message-ID: <33bf7d26.66225873@news.erols.com>
Source record: 92617

Progress report on N2CQR's 20 Meter superhet project:

>

The LM386 contributed an element of the "Joy of Scrounging" to this project! It also allowed me to put something of my own "design" into the radio. I built the AF amp with the FET preamp and it seems to work pretty well. Unfortunately it starts oscillating if I turn the gain control beyond a certain point. I'll do some pruning to see if I can solve that problem.

But no complaints here at N2CQR! I took the five boards that I built and wired them together with test leads. While I was still checking my connections, I heard some faint CW signals. Thinking that they might be coming from my Drake 2-B across the room, I ran over and turned the Drake off. CW signals were still there, coming from the speaker of my little collection of boards and wires! Lots of fun.

A couple of minor problems I need to work on:

-- I can't swing the VXO xtal as much as I should. W1FB writes of 30 khz swings, but I can't seem to move mine more than 8 Khz. (I had a similar problem with my VXO controlled transmitter.)

-- Non-linear tuning provided by my capacitor may be annoying. Frequency changes a lot in one portion of the cap's tuning range - and changes very little at the other end. I'm not sure that I can do much about this.

-- My very "bare bones" IF filter (One 3.579 xtal with a resistor to ground!) seems to provide some rejection of the unwanted sideband, but I can hear "the other side" on strong CW sigs. Doug DeMaw had one circuit in which he substituted the emitter bypass cap in the IF filter with a crystal at the IF freq. I wonder if this would work on the source bypass cap in my FET IF amp.

-- Finally, I have to think up a way of mounting all these boards into/onto some sort of cabinet/chassis. I'm looking for some system that will make it easy for me to continue to tinker with the radio.

>It worked flawless with a 4-1000 in g.g. i built a while back.
...snip...
Indeed, 7kV is about right for the '4by1' However, IMO, it is too much V,
Lane. However, if the supply is C-filtered, you might be able to convert
it to a resonant-choke filter, which would decrease the voltage to about
the right amount for a 3cx1200... .
- A major problem with the A7 is relatively high anode-to-cathode feedback
C, which results in VHF parasite problems. The feedback C problem was
overcome in the Z7. The feedback C in a Z7 is about 1/10 that in an A7.
However, a special socket is required.

Hi all,

My homepage is getting bigger and will continue to do so until
Telenordia tell me I have run out of disk space on the server.
You can find my homepage at:

http://user.tninet.se/~acz732k/

Amongst my constructional projects are:

BASIC INFO FOR BEGINNERS
How to solder
Component identification
tools

ANTENNAS
Remote tuning of tuneable antennas
Basic dipole information
Short antennas for the HF bands
A balcony/terrace antenna (worked JA on it)
Packing crate antenna
Frame antenna

RECEIVERS
Cigar box HF receiver - uses battery valves
IC HF receiver
HF direct conversion receiver
Regenerative HF receiver
HF and VHF receiver using ZN414 (ZN416)
Modifying domestic receivers for HF SSB
Modifying domestic receiver for 160 meters
Synthesized receiver

TRANSMITTERS
FM (88+108MHz) 'BUG' (can be modified for 30 MHz)
250mW HF bands CW TX
4 watt PS for the above
5 watt CW TX - dead easy to build
CW TX using voltage regulator
Single valve TX
Two valve TX
Cigar box transmitter (valve)
145MHz FM TX
QRP SSB TX
3 watt linear 1 - 30 MHz

Phasing method SSB exciter
500 watt linear amplifier
April 1st transmitter

USEFUL
VHF NBFM Crystal RX based on a coffee tin
250vDC for valves using modern components
Stereo enhancement for HF CW
CW filters
Self tuning CW filter
Q-multiplier
CW keyer using 'relay logic'

DATA/INFORMATION
QRP frequencies
Measuring micropowers
Making PCBs, several methods
G0TLAs QRP circuit database on packet
Coil winding and 'turns' calculation.

DOWNLOADING
Signal generator program
All my QRP@WW circuits in a ZIP file
PCB foil for BUG TX (later version)
'Adult' screen saver

BREWING BOOZE
Brewing beer, wine and 'mash'
Distilling the mash (3 methods)
Making liquours

---------- and more ----------

I will be adding more to the homepage constantly, as long as
I have the time available to do it.

Have fun with QRP (and QRO) de Harry, SM0VPO, Upplands V&#65533;sby.

The radio demo'd at Dayton was Kachina an HF co in Cottonwood , Az.
Search on Kachina to find their web site. Radio looked real interesting
at Dayton, specifications impressive for a $2K radio.Waiting for the
reviews to see what the lab reports say......Of course you need to
provide the PC; the interface is thru a box installed in a vacant drive
bay. I'm trying to avoid being enamoured by its novelty.

We are a New York based international photo agency representing professional and amateur photographers in search of having their work promoted in order to conduct their profession or hobby minus the time consuming inconvenience of presenting and selling their own work.
You do not have to be a professional photographer to sell your photographic work successfully, and as any pro will tell you, quite often throughout history an amateur stumbles on a scene that he or she photographs and ends up with a photo that becomes a classic. Those who publish magazines, books, newspapers, greeting cards, record albums, or just about anyone who works with images in their profession, are in desperate need of fresh material, and are more than willing to review photos submitted by professional photo representatives. Sometimes the photos of amateurs are sought after more so than professionals because of accidental originality and innovative >themes.
At Photo Phoenix International, we delight in and value the work of people who view photography as a fine art and understand a photo representative's significance in terms of a photographer's career, reputation, and monetary gain.
The photos we are seeking are some of the following: ANIMALS, ARCHITECTURE, ART, AUTOMOBILES, BUSINESS, CELEBRITIES, DOCUMENTARY, ENTERTAINMENT, EROTICA/NUDITY, FASHION, FOOD, HEALTH, HISTORY, HOBBIES, OUTDOORS, PEOPLE, POLITICAL, PORTRAITS, STILL LIFES, RELIGIOUS, SCIENCE, SPORTS, TRAVEL . . .
Whether your work portrays conservative, experimental, stylish, or innovative themes, your project proposal should be well thought out before submitting to us.
For first contact, submit a query letter and "SAMPLES ONLY" of your photos.
You must include "2" self addressed, stamped envelopes--one for correspondence, the other for the return of your material should we not be interested.
If we think your work is sellable, we will respond as soon as possible. Do not send entire portfolio unless we ask for it.
SEND TO: Photo Phoenix International

My July 96 QEX article on DSP filtering was a write-up of almost a
year's worth of learning and experimentation during my spare time.
The $650 dollars I received for the article was certainly not the reason
I did it. The main reason was that I saw a gap in the literature for this
type of tutorial, and I tried my best to fill it. From the correspondence
I've received (still, after a whole year) it seems to have worked.

>
> In retirement, I find this an interesting continuation of my electronics
> career.

I am not retired, but I do try to keep pace with cutting edge technologies
and how they might be applied to amateur radio. By completing a project
and formally writing up the results, I am helping my professional career
as well as my hobby. I sent a manuscript to QEX last month on the design
of an FPGA using VHDL and logic synthesis, to control a DDS & vacuum
fluorescent display module for my home-brew. We'll see what they do with
it.

> Each project that I do and write about is a big educational
> experience for me, if for no one else.

And in the end, that is all that really matters to me.

Hi John--

>And in the end, that is all that really matters to me.

I'm with you, John. Getting a little money back to cover expenses is nice, but that's not why I write. The best amateur and professional electronic journal writers aren't in it for the money because there's never been a significant amount of money in it. They do it for information sharing, networking, and skill development.

As ham magazines go, QST pays pretty well, they pay on time, and they have excellent circulation. Of course, at a personal level, I'd rather see the good technical articles go to Communications Quarterly rather than QEX because my wife edits it. But the thing I really have a hard time with are "writers" who whine.

What does HAM mean !? ( i am on 27mc)
And how can i messeaure that my major CB and antenna are well !? (i have a SWR(?) meter, with doubble display, one is swr, the other power in watts)

Thanx,

Barend

# 943. TS-830 Freq Jump

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-07 00:00:00 UTC
From: wormser@osiris.cso.uiuc.edu
Message-ID: <868324320.6130@dejanews.com>
Source record: 92653
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.boatanchors

Any hints on fixing my TS-830S? Here's what it does:
The freq jumps by about 100 Hz around the tuned freq on both receive
and transmit, with heaters on or off. The jumps up & down occur
every 1 to 10 seconds. The problem has "gone away" for a few days
or weeks then returns. When it acts up, it does it all the time.
I notice a crackling noise when the freq jumps.
I have checked the output voltages (9 and 3.7 V) from the AF/AVQ
board, and I have cleaned & re-seated the connectors on the VFO,
AF/AVQ, PLL, and Freq Counter boards. When the freq jumps, the
digital display does NOT blank out (service manual says that if the
PLL board loses its lock, the digital display will blank). I have
cleaned the wiper on the main VFO tuning capacitor. I have listened
to the AF/AVQ, RF, VFO, Counter, PLL, and Rectifier boards with a
stethoscope. I have tried to monitor output from the AF/AVQ & PLL
boards to see if VOM fluctuates. I'm a troubleshooting newbie!

Thanks for any help or ideas.

A couple of dB would be a very good repeatability for low-mounted VHF
beam, and positively amazing achievement on HF.

For HF antennae, few people can use them in anything even vaguely
like free-space conditions. There is plenty of room for eternal arguing
over what standard circumstances should be used for an attempt at a fair
comparison that might have any relevance to real users.

Substitution comparisons on HF aren't going to be particularly
repeatable. Creating (or finding) a signal from a distant source that
will allow the comparison to be done with the approach angle at the test
site to be typical of the signals that people are most interested in is
easy. There are beacons and commercial/government things in our bands
that output strong signals at reliable powers into stable antennae.
Unfortunately these are just the sorts of signals that will most suffer
variations in propagation. To try to separate antenna related changes
from propagation changes will need a carefully designed experiment,
probably with two similar sites. I'd still expect the uncertainty to be
comparable to the differences expected to be found between competing
brands.

> The measurement technique for antenna tuners was published in the April
> and May 1995 issues of QST. How long should we wait for people to comment?

Antenna tuner power rating can often have no single unique result.
Damage levels will depend on the impedence being tuned, worse, many
tuners have extra dimensions of freedom and can be set in many different
ways to tune the same impedence -- usually with different resonator
in-circuit-Q and thus very different power handling limits. I'm not sure
there is a "right" way to do this job, not without multidimensional
graphs. At least a reasonable compromise of tests in a few standardised
circumstances will be a vast improvement over the current anarchy.

> We tried a more direct approach with phase noise--I sent out letters
> to the manufacturers describing our technique and received silence
> in return. Of course, I needed to send out duplicates to at least

> two manufacturers after we published our first set of reviews...

Your techniques are very sensible, and the results are capable of allowing us to see the differences between competing radios at sideband frequencies appropriate to our usual modes. Sticking to a defined way of doing the measurement allows us to compare things reviewed at different times without having to try to also handle differences in ways of testing or expressing results.
To really comment on this matter with any confidence, someone needs a bit of experience with doing this sort of measurement, perhaps by developing their own phase noise testing rotine, or by developing a low-noise synthesiser. This isn't just professional territory. I have tried to make the point that useful phase noise tests could be done on a pocket-money budget with homebrew test gear, and that anyone who wanted to could make a useful contribution in low-noise oscillator development. Big budget lab equipment is convenient, but can be equalled at home by a smart amateur with shallow pockets and a little more time.
It may be that the people at some manufacturers have (as yet) little understanding of phase noise and its consequences, maybe some just buy/hire commercial automatic testers and just push the "GO" button without wondering what it does or what the results mean. Perhaps some do understand fully but didn't have time or the message didn't reach them.

Cheers
David GM4ZNX

Hi all,

My homepage is getting bigger and will continue to do so until
Telenordia tell me I have run out of disk space on the server.
You can find my homepage at:

http://user.tninet.se/~acz732k/

Amongst my constructional projects are:

BASIC INFO FOR BEGINNERS
How to solder
Component identification
tools

ANTENNAS
Remote tuning of tuneable antennas
Basic dipole information
Short antennas for the HF bands
A balcony/terrace antenna (worked JA on it)
Packing crate antenna
Frame antenna

RECEIVERS
Cigar box HF receiver - uses battery valves
IC HF receiver
HF direct conversion receiver
Regenerative HF receiver
HF and VHF receiver using ZN414 (ZN416)
Modifying domestic receivers for HF SSB
Modifying domestic receiver for 160 meters
Synthesized receiver

TRANSMITTERS
FM (88+108MHz) 'BUG' (can be modified for 30 MHz)
250mW HF bands CW TX
4 watt PS for the above
5 watt CW TX - dead easy to build
CW TX using voltage regulator
Single valve TX
Two valve TX
Cigar box transmitter (valve)
145MHz FM TX
QRP SSB TX

3 watt linear 1 - 30 MHz
Phasing method SSB exciter
500 watt linear amplifier
April 1st transmitter

USEFUL
VHF NBFM Crystal RX based on a coffee tin
250vDC for valves using modern components
Stereo enhancement for HF CW
CW filters
Self tuning CW filter
Q-multiplier
CW keyer using 'relay logic'

DATA/INFORMATION
QRP frequencies
Measuring micropowers
Making PCBs, several methods
G0TLAs QRP circuit database on packet
Coil winding and 'turns' calculation.

DOWNLOADING
Signal generator program
All my QRP@WW circuits in a ZIP file
PCB foil for BUG TX (later version)
'Adult' screen saver

BREWING BOOZE
Brewing beer, wine and 'mash'
Distilling the mash (3 methods)
Making liquours

---------- and more ----------

I will be adding more to the homepage constantly, as long as
I have the time available to do it.

Have fun with QRP (and QRO) de Harry, SM0VPO, Upplands V&#65533;sby.

I have the following sizes/colors available:

Size Color Price/ft.

20 1,4,7 .10

22 0,2,3,4,6,7 .07

24 0,5,7 .07

26 2,6 .07

Limit is 100ft./size/color for each order. Shipping is $3.00 for any amount.

Thank you,
Dale

Hello KR4WM:

I'll bet you have nice neighbors! I know several hams that transmit at high power (yes that is HIGH and not reletively high). Most have needed to buy high pass filters for various equipment for themselves and their neighbors. You can build these, but it's much easier to buy them.

I am supposing that you are running HF. If you are running VHF/UHF at these power levels, then other fixes are required.

Good luck.

You can modify a CB to transmit FM if it is a PLL rig (I doubt you could
convert a crystal rig for fs transmit). All you do is disable the AM
modulator, and feed audio from the amplifier to the PLL.

To make it recieve FM (this can be done on crystal tuned rigs), take IF off
,and feed it through an FM limiter/discriminator,and feed it into the audio
amp (or squelch gate).

Gary Tait, VE3VBF

2Moderator: Sorry if out of conference.

Hello All,

Your help is heavily requested!!!

Our company named "Multi-Communication". We were established at January 1994. Our business - trade. We have a number of branches in different countries. We employ Russian-speaking staff there. We use office alpha-numeric paging system to organise its work. We would like to buy NEC paging receivers (pagers) from you.
We would like to receive the price on NEC-21A, NEC-26B, NEC-20B and, possibly, other 2-language Cyrillic-Latin alpha-numeric pagers. Please, send us by fax delivery terms and conditions on them, too.
We consider to place an order on
1000 NEC-21A (100-200 monthly - depending on prices),
1000 NEC-20B (100-200 monthly - depending on prices),
1000 NEC-26B (100-200 monthly - depending on prices).
System:
Frequencies: 159,825+MHz and 161,950+MHz,
Rate: 1200 baud,
Format: POCSAG.
Please, call us:
007 095 921-4709,
007 095 971-5514,
007 095 971-5328.
Our fax:
007 095 921-7780.

Our email:
m-comm@dol.ru

If you have no possibility to deliver such volumes directly, please give us the list of distributors with contact numbers.

Best regards,

Dmitri Ivanov
Multi-Communication

> http://www.dejanews.com/ Search, Read, Post to UsenetHi Alan,

You've done pretty well for a newbie!
Although I have not seen this problem in a Kenwood, I have seen it in
Icom and Yaesu- both with the same cause- small single turn variable
caps. In case of the Yaesu it was a frequency netting cap on a
heterodyne oscillator- drove me nuts. It occurred randomly and never
when I had the rig open. A hint from another ham sent me looking in that
direction. Replaced 2 or 3 and that was the end of it. Hope this helps.

What is the plating? Silver plated is a battery and commits suicide
when exposed to moisture.

>Z80,6803,8088

If you want to be TNC2 code compatible, you'll have to run the Z80.
If you don't need to be code compatible, any of the three will do.

>SIO:
>8250

This is a problem. You need a USART, not a UART, because packet uses
synchronous transmission. The TNC2 uses the Z80 SIO chip, other designs
use the 8530. The 8250 won't do, it's only a UART. If you don't care about
code compatibility, you can implement a software USART in the Z80. GLB
did this for their PK-1.

>Ram: 8K Sram

That's enough to run earlier versions of the TNC2 code, but you
need 16k or 32k to run later versions.

>ROM: 2764,27256

The 27256 will do.

>Modem : TCM3105

That'll work.

As noted above, if you want to be code compatible with the TNC2, you'll have to
have a Z80 SIO chip. That's a USART. The 8250 is a UART and can only handle
asynchronous data. Packet is synchronous.

## 957. Schematics needed A and B supplies

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-08 00:00:00 UTC
From: gpewitt@execpc.com
Message-ID: <NEWTNews.868388663.21460.gpewitt@execpc.com.execpc.com>
Source record: 92667
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment,rec.radio.amateur.boatanchors

I am trying to restore a couple of battery eliminators.
The A eliminator is a "Majestic A Current Supply"
made by Grigsby-Grunow-Hinds Co. in Chicago.
It has a selenium rectifier on the front with 5 taps
which makes me think it might be set up as a bridge
rectifier. It is marked 110v ac 60 cycles with DC output
of 6 volts at 2.5 amps max. It has a seven position rotary
switch marked A through G. I'm puzzled by the switch.

The B supply is labeled Speedway B Battery Eliminator.
It was made by the Prestolite Corp. It has a BH rectifier
tube which seems to be a full wave rectifier. It has
binding posts marked I, 22, 45, 60, 130, and 180.
Puzzled by the "I" post.

The selenium rectifier is a dead short both ways. The
BH tube heats up on one side. I think I could replace
the selenium rectifier with 4 silicon diodes and some
dropping resistors if I had a schematic.

I want to get these power supplies working to use with
a couple of very nice old TRF receivers I am restoring.
One is a Cascade made here in Milwaukee in 1926 and the
other is a Blandin Phonograph Co. made in Racine WI.
about the same period.

Any Ryders, schematics, manuals (ha,ha), advise, parts,
war stories, etc. welcomed. Happy to pay for copies
of any info or paperwork.

Thanks again to all who helped with my RCA Radiola 18.
It's coming along nicely.

Dear Friend,

Greetings! I am a retired Attorney, and about two years ago a man came to me with a letter. The letter he brought me is basically the letter in your hands. He asked me to verify the fact that this letter was legal. I told him that I would review it and get back to him. When I first read the letter my client brought me I thought it was some off-the-wall idea to make money. However, a week and-a-half later we met in my office to discuss the issue. I told him the letter he originally brouht to me was not 100% legal. I suggested a few changes with which the letter would be 100% legal.

I was curious about this letter, and my client told me how this plan works and suggested that I give it a try. I thought it was a long shot and would be a wast of time, so I decided against participating. However, before my client left, I asked him to keep me updated of his results. About two months later he called me to tell me he had received over $800,000 in cash!! I didn't believe him, so he suggested that I try this idea and find out for myself. I thought about it for a couple of days and decided that I didn't really have anything to lose, so I asked my client for a copy of the letter. I followed the instructions exactly, sent out 200 copies, and sure enough, the money started arriving! It came slowly at first, but after 3 weeks, I was getting more mail than I could open in a day! The money stopped coming after about three months. I kept a precise record of my earnings, and they totaled $968,498.00!!

I was earning a good living as a lawyer, but anyone in the legal profession, or even anyone who owns their own business will tell you, there is a lot of stress that comes with the job. I told myself that if things worked out, I would retire from my job and travel. I decided to try the letter again, but this time I sent out 500 letters. Well , three months later, my earnings totaled $2,344,178.00!!! I just could not believe it. I met with my former client (and now my friend) for lunch to find out how it worked. He told me there are quite a few similar letters going around. What made THIS ONE DIFFERENT WAS THE FACT THAT 6 ADDRESSES APPEAR ON THE LIST, AND NOT 5 LIKE MOST OF THE OTHERS. This fact alone results in your name being on far more returns. Of course I was thankful that he had shown this plan to me, but he was just as thankful that I had suggested the changes to ensure that this plan was legal since most people don't want to risk doing something illegal.

I'll bet that by now you are curious to know the little change I suggested in my friend's original letter. Well, if you send a letter like this out, to be legal you must actually sell a product or service

if you expect to receive a dollar. I told my friend that anyone sending a dollar back to him must receive something in return. You have received this letter due to the participation of each of the 6 persons given below. This letter and the plan given within this letter are a "product" that you have received. Thus, you will be sending $1.00 to each of the 6 persons given below in exchange for receiving this letter and for asking them to provide the "service" of adding you on their mailing list.

THIS IS A SERVICE AND IS 100% LEGAL BUSINESS OPPORTUNITY WHICH IS COVERED IN TITLE 18, SECTION 1302 AND 1342 OF THE POSTAL AND LOTTERY LAWS.

NOW, PLEASE FOLLOW THESE TRIED AND TRUE STEPS TO OBTAIN THE AMOUNT YOU DESIRE:

1) Immediately send a $1 dollar bill to each of the 6 people on the list below. Wrap this dollar in a note with the words: "Please put me on your mailing list." (Remember, in this way, you're not just sending a dollar to someone; you're paying for a legitimate service.) Include your address. You do not need to include your name. This is the key to the program! Also, let each person know what number they are in the letter so he/she knows which cycle he is receiving the $1.00 from. Make sure that you retain EVERY name and or address sent to you, either on computer or hard copy, but do not discard the names and notes that people send to you. This is PROOF that you are truly providing a service, and should the I.R.S. or some other government agency question you, you can provide them with this proof! Therefore you will start a list of all the people who send you a dollar requesting to be added on a mailing list. Actually, you will want to safeguard this list because it can generate even better responses and much more money later! See step #4 below.

2) Remove the name next to the #1 on the list, and move the rest of the names up one position. Then place your name in the #6 spot. Thus, #6 becomes #5, #4 becomes #3, etc., and YOU will be #6 on the list. DO NOT EDIT THIS LETTER ANYMORE BEYOND THIS POINT. When you are mailing this letter, you may edit the references to the internet.

3) Post this letter in at least 250 newsgroups, I do 5 groups per post. You can simply copy the contents of this letter and past it to the newsgroups of your choice.
IMPORTANT NOTE: Please pay attention to the newsgroups in which you post. If there is an abundance of similar letters, you may want to seek another newsgroup. Thus, pat respect to the harmony of the newsgroup and use common sense. There are plenty of newsgroups on the Internet. (I think there are close to 18,000 of them.) ALSO, PLEASE POST IN APPROPRIATE GROUPS AND SPREAD YOUR POSTINGS OVER MANY DIFFERENT LOCAL & INTERNATIONAL AREAS (SPREAD THE WORD)!
For added success, you can also mail this letter as well, in addition to posting in newsgroups. Order 200 (or more) names from a mailing list company. Two that have been most effective for these names are:

S.E. Mailing List Advon Distributors
P.O. Box 15061 P.O. Box B-11
Ft. Lauderdale, FL 33318S Helly, ID 83274
(954) 742-9519 (800) 992-3866

4. Keep a copy of this letter so you can use it a second time. Also keep EACH AND EVERY NAME AND ADDRESS SENT TO YOU as instructed in #1. Then, send out more copies in about 6 months, but mail it to the addresses you receive (your new mailing list) with each dollar! It will work again, only much better!

Here are the addresses that you must send a dollar to with your slip of paper requesting placement on their mailing list, as instructed above:

1. Ron van Hoof
14 Moshier St.
Greenwich, CT 06831
USA

2. Richard Blanchette
Pob 455
Palisade, Colorado
81520
USA

3. Caroline Mowinckel
Molnar Utca 21
2 Em Nr-10
H-1056 Budapest
Hungary

4. Odd Hilsen
Avda Espana 93
Sitio de Calahonda
Mijas Costa - Malaga
Spain

5. Peter Kjoge
Camino de la Condesa 9, 5-A
E-29640 Fuengirola
Spain

***THIS PLAN WILL NOT WORK UNLESS YOU SEND $1.00 TO EACH OF THE ABOVE PERSONS AS DIRECTED.

How do the numbers work for potential income earnings?
Assume for the sake of example that you get a 7.5% return rate. This is a very conservative, my first attempt was about 9.5%, and my second was over 11%.

1. You send out 250 letters, and 18 people (250 x 7.5% = 18) will send $1 each. $18.00

2. Those 18 send out 250 letters each, and 337 people (18 x 250 = 4,500x 7.5% = 337), send you $1 each. $337.00

3. Those 337 send out 250 letters each (337 x 250 = 84,250 x 7.5% = 6,318), and 6,318 people send you $1 each. $6,318

4. Those 6,318 send out 250 letters each (6,318 x 250 = 1,579,500 x 7.5% = 118,462), and 118,462 people send you $1 each. $118,462.00

5. Those 118,462 send out 250 letters each (118,462 x 250 = 29,615,500 x 7.5% = 2,221,162), and 2,221,162 people send you $1 each. $2,221,162.00

ADD 1-5 AND TOTAL AT $2,346,297.50

ALL THIS IS AT A 7.5% RETURN ON YOUR LETTERS. THAT'S 18 REPLIES ON YOUR ORIGINAL 250 POSTINGS.

Some valuable, general suggestions:

1. DO NOT TRY AND CHEAT THIS PROCESS. IF YOU DO, YOU WILL NOT ACHIEVE THE DISIRED RESULTS.

2. The Internet is a very effective medium for exposing this vehicle. However, pay attention to newsgroups, and avoid posting this letter in the newsgroups where there are a lot of upset epeople complaining about "spamming." In other words, we are asking that you use common sense, and have courtesy to others on the Internet. This may be opposite of what many other similar postings may be saying. Keep in mind that there are plenty of people out there who believe and want this as much as you do.

3. Keep a positive frame of mind while engaging in this process, and you will receive the amount of money you desire.

4. In order to achieve maximum results DO NOT CHANGE THE CONTENTS OF THIS LETTER. However, you may edit applicable portions relating to Internet when sending this letter via regular mail.

5. When the money begins to arrive, it is a good gesture to give 10% or more to your church or favorite charity with a joyful spirit.
The Internet has proved to be a very quick and effective means to reach millions of people with your message. This message exemplifies a UNIVERSAL LAW OF ABUNDANCE that there is plenty to go around for everyone. You will not be hurting anyone and will be creating the opportunity for those who read your message to benefit--just as you will--from the abundance that exists in this universe.

# 960. Re: TS-830 Freq Jump

That's a pretty thorough job you did! It's a common problem - I had it too - and is due to poor grounding on the AF board whoich also carries the main voltage regulators for the whole rig. The Kenwood recommended solution is to insert extra-vicious star washers under each of the ground pillars.

Some people suggest a separate ground lug to a new hole in the chassis, but the simple solution worked for me.

You can certainly find out more about this and other modifications by searching both the Web and Usenet for "TS-830".

I would also suggest a number of other things to look at.....
1. check your earthing is OK, if you are a way up from a reasonable
ground then run 1/4 wave radials for each band, though I use ones for
80, 20 and 10 they seem to keep RF quiet on all bands. Remember to tape
off the ends from pets or anyone who may accidentally touch them and get
a nasty RF shock.
2. Be conservative in the amount of speech compression you use on SSB or
excessive harmonics can be generated, on a high power amp, keep the ALC
well back.
It's not always the fault of the amateur, the equipment makers
sometimes design nice looking cases with front-ends that have very
little immunity to RF. It's been a problem for years with domestic
equipment, the Regs. here in Europe were supposed to be tightened some
years ago, making the makers responsible if it could be shown that your
RF output is "clean".

## 966. antenna gain and the ARRL stance

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-08 00:00:00 UTC
From: Fred <peerenbf@dma.org>
Message-ID: <Pine.LNX.3.95.970708204335.12251B-100000@dmapub.dma.org>
Source record: 92676

I agree that there should be some standards set up. And by our leadership or those that claim leadership. Most ads mean nothing as far as antenna performance in the field is concerned.

The biggest problem with antenna gain figures is not in the manufacturer or the field testing though. It is not in the leaderships stance on whether to publish or not publish them. It is in the mounting, erecting and using pratices that the every day ordinary Joe ham uses. We all take a test to get this license. And then we seem to set that all aside when that piece of paper comes and just do what "looks good" for an antenna and then get bent out of shape when it "jest dont work dang it" and you can't imagine why that 100000 Dbi super cloud burner beam won't get a good signal into the next neighborhod, let alone town.

So until the manufacturer can come up with a set of figures to approximate the average installation, no published gain figures will mean anything at all except to a ham that has access to a test range with controlled conditions to work in. If you want some insight into this talk to some of the folks that design and build commercial FM antenna installations. Like ERI for example. I have had the chance from my work as an engineer in radio. It is very eye opening to say the least. Gain figures on paper are one thing, in practice they can be something very differant.

I guess this soap box is getting mighty slippery for me here so I had better step down and let others speak there piece. Hey, if the leadership is not leading, it is time to change that leadership. But if none of us step forward to be counted and run for any office, well just who do you think will be the leaders next year???? Yer right, the ones from last year!!!! I am as guilty as the next when it comes to talk. Talk is cheap so I guess it is time to put up or shut up. Start at the local level and run for your club prez spot, and then do something good for the club when you get railroaded in because no-body else wants the spot as it involves work. (ugh, that 4 letter word) If the national movement will not provide some testing sites, how about a local campaign to get one. I see the various vhf/uhf societies around comming up with solutions to that one. There has to be an answer other than just complaining about it.

Make MONEY...
The fact that so many people have taken the time to post to 250 newsgroups
or more should convince you that this one REALLY works!!!!! Look at this
man's story, then the rest of the original:

I thought, what the heck, I'll try it. It's only six dollars. I didn't do
it right at first, I only sent out to about 30 newsgroups. But, I got back
my six dollars and actually made $159.37 in a week (someone put
some change in the envelope). Anyway, now I'm going to do this the
right way; send out to 250 newsgroups! The rest of this letter is just a
cut and paste from the original. All I can say is that it works. I
would never have believed it if it didn't happen to me. Just remember, we
must all follow the rules. Be HONEST and FAIR and you will make money!
Sure is a lot of mail though!

Thanks for reading!
C.L.
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
MAKE A FORTUNE - AND THIS IS THE ABSOLUTE TRUTH!

IF YOU HAVE READ THIS FAR YOU HAVE ALREADY PROVED IT WORKS!!

Take just 5 minutes to read this and see.

This is the newest updated version.

As I was surfing the net, I read all these postings on how you can make
over $50,000, even $800,000.
Well I believe that if all goes well, and you follow the rules EXACTLY,
it
will work. Just follow the
instructions given in this letter, and you to can make over $800,000,
perfectly legally according to USA
Post Office Laws (read on for specifics). Don't look at this as a
money-making scam, but rather a true-to-
life example to test the above statement. It will only cost you $6
dollars
plus 6 stamps, and a few hours of
your time. Thus, there is some effort involved, because nothing in life
is
absolutely free. Are you ready

and willing to accept that you deserve to receive a fair amount of money?
If so, please continue reading.
But if you think this is just another scam, I suggest that you don't try it.

PLEASE NOTE: THIS IS A 6-PERSON LIST, NOT THE USUAL 5. PLEASE DO NOT TRY
TO CHEAT THIS PROGRAM. JUST ADD ONE NAME AND REPOST THE ARTICLE. IF YOU DO
NOT IT WILL NOT WORK, AND YOU WILL BE REMOVED. FROM THE LIST! FOLLOW THESE
DIRECTIONS AND JOIN US IN A GREAT OPPORTUNITY!

The program has been revised and you will notice six names instead of five.
The reason for this is the
flood of five name programs and the sixth name will add $50000 to $100000.
This is proven mathematically and in my bank account. I never really thought that this program would work, but IT DOES and it will for you too.
Just be patient and follow the directions exactly. Print this article now,
so you have all the information for your version. Remember to keep the names right. Let's go!

STEP 1

Invest your $6 by writing your name and address on six separate pieces of
paper along with the words:
"PLEASE ADD ME TO YOUR MAILING LIST".
(In this way, you are not just sending a dollar to someone; you are paying
for a legitimate service.)

People have asked me if this is really legal. It is! You are using the Internet to advertise your business. What is that business? You are assembling a mailing list of people who are interested in home based computer and on-line businesses and methods of generating income at home.
Remember - people send you a small fee to be added to your list. It is legal. What will you do with your list of thousands of names? That's up to
you, but this is how it becomes legal. To be legal you must actually sell a
product or service if you expect to receive a dollar. Anyone sending a dollar back to you must receive something in return. You have already received this letter due to the participation of each of the 6 persons listed below. This letter and the plan given within this letter are a "product" that you have received. Thus, you will be sending $1.00 to

each
of the 6 persons given below in exchange for receiving this letter and
for
asking them to provide the "service" of adding you to their mailing
list.

THIS IS A SERVICE AND IS A 100% LEGAL BUSINESS OPPORTUNITY WHICH I
COVERED
IN TITLE 18, SECTION 1302 AND 1342 OF THE POSTAL AND LOTTERY LAWS.

Now, please follow the given steps exactly to receive your desired
amount
of money:
Immediately send $1 US cash (a one dollar bill, no checks, no money
orders)
to each of the 6 people on the list below. Wrap this dollar in a note
with
the words: "Please add me to your mailing list." (In this way, you're
not
just sending a dollar to someone, you're paying for a legitimate
service.)
Also, to discourage those who prey on cash in the mail, be sure the bill
is
completely hidden by the note. A woven envelope is recommended. Include
your address. You do not need to include your name. This is the key to
the
program! Also, let each person know what number they are in your letter
so
he/she knows which cycle he is receiving the $1.00 from. Make sure that
you
retain EVERY name and address sent to you, either on computer or hard
copy,
but do not discard the names and notes that people send to you. This is
PROOF that you are truly providing a service, and should the IRS or some
other government agency question you, you can provide them with this
proof.
Therefore, you will start a list of all the people who send you a
dollar
requesting to be added to a mailing list. Actually, you will want to
safeguard this list because it can generate even better responses and
much
more money later! Fold a $1 bill inside each paper, and mail them by
standard mail to the following six addresses:

1) Rudolfs Osins
Aspazijas 37-4
Jelgava, LV 3001
Latvia
2) J. DiMauro
89 East Squire Dr. Apt. 1
Rochester, NY 14623

USA
3) D. Fenter
24 Hornsilver Place
The Woodlands, TX 77381
USA
4) R. LAWSON
P.O. BOX 842
BRISTOL,VA.
24203-0842
USA
5) B. Cody
1156 Auraria Rd.
Dawsonville , GA
30534
U.S.A.
6) C.L.W.
3015 So. Coker St.
Greenwood, AR.
72936
USA

STEP 2

Now remove the top name from the list, and move the other names up. This
way #6 becomes #5 and so on. Put your name in as the #6 on the list
(Remember to take #1 off and change the numbers so #2 becomes #1, #3
becomes #2, #4 becomes #3, #5 becomes #4 and #6 becomes #5 and you become
#6.)

STEP 3

LET ME TELL YOU HOW MUCH MONEY YOU CAN MAKE.

How do the numbers work for potential income earnings? Assume for the sake
of example that you get a 7.5% return rate. This is very conservative; my
first attempt was about 9.5%, and my second was over 11%.
1. You send out 200 letters, and 15 people (7.5% x 200) will send you $1
each. $15.00
2. Those 15 send out 200 letters each, and 225 people send you $1 each.
$225.00
3. Those 225 send out 200 letters each, and 3,375 people send you $1
each.
$3,375.00.
4. Those 3,375 send out 200 letters each, and 50,625.00 people send you
$1
each. $50,625.00
5. Those 50,625 send out 200 letters each, and 759,375 people send you
$1

each. $759,375.00
6. Those 759,375 send out 200 letters each, and 11,390,625 people send you
$1 each. $11,390,625

TOTAL $12,204,240.00!! That's 12 million dollars. If those figures sound
incredibly high, figure
that even with half the return rate, or even a quarter, the total is still
spectacular. It works every time, but how well will depend on how many
letters you send. In the above example you mailed out 200 letters. This
sounds like "pie in the sky," but the numbers add up, and with over 40
million people on the NET, it works! TIP: For an even greater return,
post to MORE than 250 newsgroups initially; try for 300-350. When your
name drops off a list, simply access another message from a newsgroup and
start the process over again. Post the new article to at least 250
newsgroups. remember, the more you post, the more people see, and the more
you get. There are at least 25,000 newsgroups at any one time. This is a
$7.92 investment. It takes about a week or so to start seeing a return-so
be patient. The money should flow for about 3 months. At that point, simply
add your name to the list and start over. I've done this three times and
now I can quit my job and start investing in real estate full time. I
assure you this can work. If you mailed out 500 letters, you could have
received even more! Check the math yourself, but I guarantee it's correct.
With this kind of return, you have got to give it a try! Try it once, and
you'll do it again. Just make sure you send a dollar to each of the
addresses on the list above with a note asking to be added to their mailing
list. Together we will all prosper and we will be able to share our wealth
with those less fortunate than ourselves.

GOOD LUCK!!

GENERAL STEPS ON AUTOMATING THE PROCESS
---
If you have Netscape 3.0 do EXACTLY the following:
1) Click on any newsgroup like normal, THEN click on 'TO NEWS', which is
on the far left when you're in the newsgroups page. This will bring up a
box to type a message in.

2) Leave the newsgroup box like it is, CHANGE the subject box to
something
flashy, like, "NEED
CASH $$$ READ HERE $$$ or "FAST CASH"!!!

3) Tab once and you should be ready to type. Now, retype (only once)
THIS
whole article WORD FOR WORD, except insert your name at #6, and remove
#1
off the list, plus any other small changes you think you need to make.
Keep almost all of it the SAME!

4) When you're done typing the WHOLE article, click on FILE in THIS
BOX,
RIGHT ABOVE SEND, NOT WHERE IT SAYS NETSCAPE NEWS ON THE FIRST BOX.
Click
on SAVE AS when you're under FILE. Save your article as a text file to
your C: or A: drive. DO NOT SEND OR POST YOUR ARTICLE UNTIL YOU DO
THIS.
Once saved, move on to number 5 below. NOTE: If you don't want to type
in
the whole article by hand, AND you know how to use a plain text editor
(like Notepad), you can edit the file ahead of time, then attach it as
shown in step 6.

5) If you still have all of your text, send or post to this newsgroup
now
by just clicking send, which is right below FILE, and right above Cc:

6) Here's where you're going to post all 200. OK, click on any
newsgroup
then click on 'TO NEWS', again in the top left corner. Leave the
NEWSGROUPS BOX alone again, put a flashy subject title in
the SUBJECT BOX, hit TAB once you're in the body of the message. Click
on
ATTACHMENTS, which is below the SUBJECT BOX. You will get another box
to
come up. Click on ATTACH FILE, then find YOUR file that if you did this
right, you should see your file name in the attachments box, and it will
be
shaded green. NOTE: If you don't want to type in the whole article and
you know how to use a plain text editor (Notepad), you can edit the file
ahead of time, then attach it.
**********
1) IF YOU USE I.E. EXPLORER IT'S JUST AS EASY...HOLDING DOWN THE LEFT
MOUSE BUTTON, highlight this article. Then press the "ctrl" key and the
"c" key at the same time to copy this article. Then print this article
for
your records, to have the names of those you will be sending $1 bills
to.

2) Go to the news groups and press "post an article". A window will
open. Type in your headline in the subject area and then click in the

large window below. Press "ctrl" and then "v" and the article will be placed in the window. If you want to edit the article, do so and then highlight and copy it again. Now every time you post the article in a new
newsgroup all you have to repeat is "ctrl" and "v" and press post.

3) That's it. Each time you do this, all you have to do is type in a different newsgroup, so that way it posts to 200 DIFFERENT newsgroups, or
more. You see? Now you just have 249 to go!! (Don't worry, each one takes
about 30 seconds, once you get used to it. REMEMBER 250 IS THE MINIMUM. But the more you post the more money you will receive. AND THAT'S IT!! THEY ARE ONLY STEPS!!!
---
(this is a later addition for extra ease of posting)

EXTRA TIPS:

(ONLY) IF YOU ARE CONFIDENT WITH YOUR COMPUTER YOU CAN AUTOMATE YOUR POSTINGS (and prevent spamming) AS FOLLOWS: (THIS Replaces the previous section only i.e. 'GENERAL STEPS ON AUTOMATING THE PROCESS') (using Netscape):

As you are reading this message click on "file" - "save message as", enter
a filename in the 'save as' dialog box, press "enter". Now open "Notepad"
(usually from "start" - "programs" - "accessories") and open the message (
"file" - "open" ) you just saved. (You will find it in the same folder you
saved it and you may also find it has a '.html' file extension). Then edit
the letter EXACTLY as you have been directed above.
Just make sure you delete the 'system-message' that appears at the top so
that it makes sense when you read it! Click on "edit" - "select all" (all
the text should now be highlighted) then again "edit" - "copy".
Leave Notepad alone for now and return to the Netscape News program:
Click on "options" - "show all newsgroups". Now select (subscribe to) whichever groups you think are suitable by moving down the entire listing
and clicking in the appropriate empty boxes. Once you have finished click
"options" - "show subscribed newsgroups". Now simply click on the first group you want to post to, to highlight it. Then choose the group about 10
further on and WHILE HOLDING DOWN
THE SHIFT KEY click on it. Next click on "file" - "new news message". A

message box will appear and after entering the "flashy" subject line, position the cursor in the main message area. Click on "edit" -"paste"; the message will appear.
NOW CHECK IT!!
When you are satisfied everything is correct click "send" and it will be sent to all 10 groups. Now repeat as many times as you need- very simple!
PLEASE NEVER post to many more than 10 with any one message since the resulting long lines of newsgroup listings at the top of EVERY message will
annoy many AND will vastly reduce the effectiveness of your posting.

JUST ONE OTHER THING:

Let's remember that there are many people far less fortunate than ourselves
who will never be able to afford a computer and hence will be unable to join in our enterprise. Therefore please consider donating a (significant)
portion of your earnings from the venture to charity.

NOTE -- "edit" - "copy" is exactly the same as pressing "ctrl" with "c"
"edit" - "paste" is exactly the same as pressing "ctrl" with "v"

---

## 970. FS:Teflon Silver Wire #18

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-08 00:00:00 UTC
From: don.phelps@infoway.com
Message-ID: <868427127@infoway.com>

I will sell Teflon insulated, Silver coated stranded #16 (19/29)
wire, orange with white stripe, to good home.
Minimum order is price of 50 ft, maximum unbroken length is 1000 ft
to first order etc. (max length of reel gets shorter with each order)
This #16 is tougher and stronger due to Teflon,
yet pliable and easy to work with due to stranded.

Price per foot $ 0.20/ft
Shipping is at cost,
e-mail me at don.phelps@juno.com
to discuss what you want shipped how, etc.
See my local ARC at http://www.qsl.net/w6sg
I am at http://www.qsl.net/n6mce

Js> What is the wire material? Solid or stranded? Is 100 ft limit minimum
Js> sale or maximum unbroken length? Any idea of #20 breaking strain?

## 972. Hombrew Amplifier Information

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-08 00:00:00 UTC
From: mentor@cin.net
Message-ID: <33c278e0.1082058@news.cin.net>
Source record: 92682

Thanks for reading this. After many years of homebrew INactivity, I'd like to tackle a homebrew HF amplifier project. I have the ARRL Handbook, Radio Handbook, and some articles from QST, etc., but I'd like your advice on what are the best amplifier configuration is these days. Are the 3 x 500Zs still the best value or are the new generation zero bias tube (expensive!) better? I would be grateful for any construction plans or articles.

Thanks in advance for your reply. Jim K9RII

Absolutely not! Your split band processor was a classic. I had a lot
of fun building it and look forward to seeing more of your projects in
print. If the publishers are too cheap to pay, and too uncivilized to
even say "thank you," or otherwise acknowledge your efforts, then it
is up to those of us who take your ideas and either copy them or adapt
them to our needs to let you know how much we appreciate what you have
done. Thanks Wes, very much!

## 983. Lots of cct ideas

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-09 00:00:00 UTC
From: Harry Lythall <no.one@no.where>
Message-ID: <33C418C6.4A1C@no.where>
Source record: 92689
Cross-posted to: uk.radio.amateur,rec.radio.shortwave,rec.radio.cb,rec.radio.amateur.boatanchors,rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,aus.radio.amateur.misc,nl.radio.amateur

Hi all,

My homepage is getting bigger and will continue to do so until Telenordia tell me I have run out of disk space on the server. I am currently building an HF bands general coverage receiver using valves. When I can get a 'round-twit' I will be posting this as well as the others listed below. I will present it in several logical stages, each of which is a complete project in its own right.

You can find my homepage at:

http://user.tninet.se/~acz732k/

I make no apologies for the NO.ONE@NO.NAME address. My address is freely available on my homepage - I just don't want all the adverts and junk mail that goes with a correct address.

Amongst my constructional projects are:

BASIC INFO FOR BEGINNERS
How to solder
Component identification
tools

ANTENNAS
Remote tuning of tuneable antennas
Basic dipole information
Short antennas for the HF bands
A balcony/terrace antenna (worked JA on it)
Packing crate antenna
Frame antenna

RECEIVERS
Cigar box HF receiver - uses battery valves
IC HF receiver
HF direct conversion receiver
Regenerative HF receiver
HF and VHF receiver using ZN414 (ZN416)
Modifying domestic receivers for HF SSB
Modifying domestic receiver for 160 meters
Synthesized receiver

TRANSMITTERS
FM (88+108MHz) 'BUG' (can be modified for 30 MHz)

250mW HF bands CW TX
4 watt PA for 250mW HF bands CW TX
5 watt CW IC TX
CW TX using voltage regulator
Single valve TX
Two valve TX
Cigar box transmitter (valve)
145MHz FM TX
QRP SSB TX
3 watt linear 1 - 30 MHz
Phasing method SSB exciter
500 watt linear amplifier
April 1st transmitter

USEFUL
VHF NBFM Crystal RX based on a coffee tin
250vDC for valves using modern components
Stereo enhancement for HF CW
CW filters
Self tuning CW filter
Q-multiplier
CW keyer using 'relay logic'

DATA/INFORMATION
QRP frequencies
Measuring micropowers
Making PCBs, several methods
G0TLAs QRP circuit database on packet
Coil winding and 'turns' calculation.

DOWNLOADING
Signal generator program
All my QRP@WW circuits in a ZIP file
PCB foil for BUG TX (later version)
'Adult' screen saver

BREWING BOOZE
Brewing beer, wine and 'mash'
Distilling the mash (3 methods)
Making liquours

---------- and more ----------

I will be adding more to the homepage constantly, as long as
I have the time available to do it.

Have fun with QRP (and QRO) de Harry, SM0VPO, Upplands V=E4sby.

If you don't want to write code, then you *must* use the parts that the
code you'll use is written to support. If it is TAPR code you'll be using, then
you must use the USART TAPR used. You can't even substitute a better
USART, like the 8530, because it isn't code compatible at the register level
with the Z80 SIO. You can take some liberties with things which aren't
directly code driven, such as the modem chip, but those things which are
code driven must be exactly what the code expects to see. Firmware driven
systems are totally unforgiving in that respect.

Sure, just use an external duplexer oriented so the "antenna" connection
goes to the radio, and the VHF and UHF connections go to their respective
antennas. A duplexer works in either direction. You'll get a little more insertion
loss because you now have two duplexers (the one in the radio, and the
one external to the radio) in series, but that shouldn't matter much unless
you're contemplating real weak signal work.

Okay... first thanks to all that replied via email or back here.
But my question new question is.... is there a point (this is going to get complicated) where it is possible to pull a low-power RF signal out of my FT-5100 ( I know things are really small in there, but its worth asking), use an external linear for each band and skip the internal duplexor???? I have looked at the schematics in an effort to find likely candidates, but again, Im not trained enough in RF or analog signals to be able to determine....

jtz

ps, yes, I only have a "affirmative action" license, but the fact that Im trying to do this stuff and learn how should indicate that I'm not merely trying to leech off the knowledge of the veterens.

: Is a Comb Generator ckt useful for producing known frequency markers?
: If Comb is useful for markers, where can I obtain design info or who
: sells it as a kit? I'd rather build my own.

A comb generator can be easily made from digital logic, although
very fast logtic will be required at the freqs of interest to you.

If memory serves, a perfect square wave would have only odd hormonics,
and the amplititude falls off very rapidly. To get both odd and
even hormonics, and a flatter freq response, you need to turn the
square wave from the xtal oscillator into a digital pulse, as narrow,
as possible, and with as fast a rise time as possible.

Take the sq wave, and connect it to one input of a 74AS00 gate and
also to an input of an inverter, a 74AS04, or another section of
the 74AS00 with the inputs tied together. Tie the output of of the
inverter to the other input of the 74AS00. Most of the time, input
A will be high and B low or vice versa, and output Y will be high.
Only when the oscillator switches from low to high, A will be high,
and B will still be high because of the delay of the inverter will
the output go low. Thus a narrow spike is created. It may be necessary
to put 3 inverters in series to get the proper delay for this to work.

Source record: 92563

Hi all,

My homepage is getting bigger and will continue to do so until Telenordia tell me I have run out of disk space on the server. I am currently building an HF bands general coverage receiver using valves. When I can get a 'round-twit' I will be posting this as well as the others listed below. I will present it in several logical stages, each of which is a complete project in its own right.

You can find my homepage at:

http://user.tninet.se/~acz732k/

I make no apologies for the NO.ONE@NO.NAME address. My address is freely available on my homepage - I just don't want all the adverts and junk mail that goes with a correct address.

Amongst my constructional projects are:

BASIC INFO FOR BEGINNERS
How to solder
Component identification
tools

ANTENNAS
Remote tuning of tuneable antennas
Basic dipole information
Short antennas for the HF bands
A balcony/terrace antenna (worked JA on it)
Packing crate antenna
Frame antenna

RECEIVERS
Cigar box HF receiver - uses battery valves
IC HF receiver
HF direct conversion receiver
Regenerative HF receiver
HF and VHF receiver using ZN414 (ZN416)
Modifying domestic receivers for HF SSB
Modifying domestic receiver for 160 meters
Synthesized receiver

TRANSMITTERS
FM (88+108MHz) 'BUG' (can be modified for 30 MHz)
250mW HF bands CW TX
4 watt PA for 250mW HF bands CW TX

5 watt CW IC TX
CW TX using voltage regulator
Single valve TX
Two valve TX
Cigar box transmitter (valve)
145MHz FM TX
QRP SSB TX
3 watt linear 1 - 30 MHz
Phasing method SSB exciter
500 watt linear amplifier
April 1st transmitter

USEFUL
VHF NBFM Crystal RX based on a coffee tin
250vDC for valves using modern components
Stereo enhancement for HF CW
CW filters
Self tuning CW filter
Q-multiplier
CW keyer using 'relay logic'

DATA/INFORMATION
QRP frequencies
Measuring micropowers
Making PCBs, several methods
G0TLAs QRP circuit database on packet
Coil winding and 'turns' calculation.

DOWNLOADING
Signal generator program
All my QRP@WW circuits in a ZIP file
PCB foil for BUG TX (later version)
'Adult' screen saver

BREWING BOOZE
Brewing beer, wine and 'mash'
Distilling the mash (3 methods)
Making liquours

---------- and more ----------

I will be adding more to the homepage constantly, as long as
I have the time available to do it.

Have fun with QRP (and QRO) de Harry, SM0VPO, Upplands V=E4sby.

# 1005. If You've Got $3-5k Rig, Stay Away From Web Page

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-10 00:00:00 UTC
From: the@primenet.com
Message-ID: <the-ya023580001007970139190001@news.primenet.com>
Source record: 92565

I had thought Sherwood Engineering had gone out of business. They used to make all sorts of filters for the R4-C, along with some other items.

But they are still around, with a nice web page at:

http://sherweng.com/table.html

This particular page lists 2khz spacing IMD results for old and modern rigs. No wonder the ARRL deleted this list from the back of the Low Band DXing Book! Its positively embarrassing for anyone promoting the latest Japanese rigs!

The R4-C with narrow first IF filters still reigns supreme in real-world contest and DXing conditions with the highest narrow spacing dynamic range.

Of course, the R4-C with the special filters works the best because it is equivalent to a single-conversion receiver. The latest Japanese rigs all use roofing filters and up-conversion, which means if you are working DX in a pileup you get "crunch-crunch-crunch".

You can still build your own receiver with much higher performance than even the Drake. One of my receivers has 110db dynamic range at 2khz spacing, with a narrow filter.

If I owned one of those $3000 or more transcievers, I'd be asking some serious questions. I guess if you've spent the money though, its easy to "suspend the disbelief". :) :)

Happy operating, suckers!

Rob.

Jason,

Do not worry about the duplexor in the rig nor the additional losses of using a second one to (re-) separate the freqencies at the antenna. Maybe you should email me for details, but you can easily place amplifiers and preamplifiers at the appropriate (and I'd add - correct) locations to overcome all of your worries. I have a 250' run from the shack to my tower and I work mainly on 2m & 70cm weak signal SSB. I use 7/8" 75 Ohm hardline and pairs of duplexors to share the hardline on several bands. For example, I get a hair over 2db loss between the rig an the antenna (actually the base of the tower) on 70cm after going through duplexor, lightning arrestor, 1/4 wave transformer, 200'+ of hardline, another set of 1/4 wave transformer, lightning arrestor, & duplexor. This line is shared with 2m. My other line is shared between 6m and HF. I do the same thing again for the run to the satellite station. At the point where my stacked yagis attach to the feedline I put a preamp to set the noise figure and overcome the feedline losses on the return trip. This works very well for me. Check out my ham page off of my home page (in a few days after I add a few things) at http://wwwp.exis.net/~zawodny for a few photos.

Talk to you soon, nephew.

IMMEDIATE Openings for Controls Engineers and an AUTOCAD Professional

Martin Automatic, Inc., 1661 Northrock Court, Rockford, Illinois, is a machine tool OEM with excellent benefits and competitive salary. We employ over 250 people, have been in business over 30 years, and do business internationally. We have an informal and cooperative work place atmosphere.

Machine controls design to customer specs. Vector, servo drives from various mfgs.; PLCs from various mfgs.; dedicated controllers of our own mfg.; pneumatics; etc. If you like to be exposed to a variety of challenges, this is the place for you!

My departments consist of: Electrical Engineering; Lab (R&D, assembly, electronics repair); Electrical Panel Assembly; Network&Internal Data Systems; Programming (dedicated micro-controllers and company IS systems). I am always interested to speak with bright, capable people that can contribute to Martin Automatic's future.

If you have any questions or would like to schedule an interview, please feel free to contact me, 815-654-4800 or emilgborys@worldnet.att.com. I conduct interviews myself, not through a personnel dept., and I will notify you of the results promptly and in person.

# 1012. Re: Comb Generator versus Marker Generator

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-10 00:00:00 UTC
From: Mark Mansfield <mmans@aeneas.net>
Message-ID: <33C4ED0E.2D4F@aeneas.net>
Source record: 92572

There is a circuit for a comb generator in the Nov. 1989 issue of
Ham Radio magazine. Look on page 23 for the circuit. It is all
discrete components. It uses a 100MHz crystal that is gated on and
off at a slow rate using a 555 timer IC.
You should be able to get copies of the article from your local
library using interlibrary loan (provided they don't carry Ham Radio
magazine). The article title is "Wideband Frequency Analyzer" by
Adelbert Kelley. It starts on page 9 and goes thru page 23.

Hope this helps,
Mark

True - unlike *73*.....Wayne Green supposedly has tons of money. Maybe he figures he can take it with him, Rick.

>.they pay on time,

- unlike *73*.

>...and they have
> excellent circulation. Of course, at a personal level, I'd rather see the
> good technical articles go to Communications Quarterly rather than QEX
> because my wife edits it.

QEX was reportedly past QST Editor Paul L. Rinaldo's (W4RI) idea, Rick. The basic plan was to get more subscription money from members by selling two magazines in place of what had been one magazine. IMO, QEX siphoned good articles from QST. The resulting vacuum in QST was filled with boring advertising.
- However, Communications Quarterly does not have an empowered Technical Editor. Around the first of the year I saw a letter in Comm. Quarterly that contained 3 technoblunders. In the publishing biz, credibility is everything. IMO, the Editor lacks the technical knowledge needed to preserve the credibility of the publication.

> But the thing I really have a hard time with
> are "writers" who whine.
>
Which writers have whined about which of your articles, Rick?

The QST authors I know have been fairly supportive in the controversy over my articles. Most of my grief has come from whining, wealthy QST advertisers whose amplifier designs appear to have easily-fixed measurable problems.. // As a result of the controversy, some of the QST authors I

know have decided to submit no more articles to QST. IMO, the denouement was when QST (9/94) allowed a self-recognized amplifier "expert" to critique an article that he had obviously not read. His statement that VHF currents do not flow in "coils" (because inductive reactance increases with freq.) pretty much sums it up. The following month, in the 10/94 issue, QST carries 30-something full page advertisements from the "expert's" employer. No rebuttal is allowed. Hmmmm. In the 2/96 issue, the QST Editor says why no rebuttal was allowed. Thanks to the Internet, interested QST readers can see that the QST Editor's 2/96 statement doesn't wash. In the publishing biz, credibility is everything.

Air.

Almost any insulator works by the general principle of air contained in a material, so that the air won't move, and conduct heat by convection.

Closed cell foam with a very low specific mass(tempex), glass-fiber wool, even cork or balsa-wood will insulate pretty good. However, don't make the mistake of packing too tight. It's the air, not the material that insulates.

Need something better? No air. A vacuum will work even better, but is difficult to implement.

Also, check where your heatloss occurs. It might be something as mundane as the wires leading out of the oven..

# 1018. Ten Tec 2m kit No. 1220 - L14 notes

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-10 00:00:00 UTC
From: dpt@super.zippo.com
Message-ID: <33c50947.3085259@snews.zippo.com>
Source record: 92578
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

These notes are regarding Phase 2.0 of assembly and testing. These are my notes, based on my experience and a brief talk with Ten Tec. Steps referred to are in the manual I got which doesn't seem to have a revision, but the part number is 74320 and the PROM version in the kit was 2.1.

Before installing L14 (step 2-2) be sure you turn the slug all the way up and down the coil. My slug got stuck part way down and I had to remove the coil and drill it out. Resoldering the coil back into the curcuit is difficult if you cut the leads as short as they suggest.

It is my guess that my coil was wound too tight and was compressing the tube. Of course, I was only 1/4 turn or so from having it adjusted when it stuck.

In step 2-77 it refers to the voltage dropping when adjusting L14. This is not always the case. My voltage _increased_ to the proper level when adjusting L14 as described. The guy at Ten Tec must have known about this because he was able to guess my initial reading within .02 volts. He also said this is of no concern, so long as the voltage levels work as described in step 2-78.

On a more positive note... Ten Tec is sending me a new coil and slug. I was able to talk with someone who knew about this without wating on hold. The manual is excellent, while no manual can cover everything you can do wrong, this one actually stopped me from putting in the wrong part twice already. The hardware is all high quality.

I have a commercial wattmeter/dummy load for sale. This is a Sierra Model Z-99 that is rated at 52 ohms, 50-600 Mhz. for 200 watts with a built in wattmeter calibrated to 200 watts. This is a top quality commercial wattmeter that can easily be used for amateur or commercial use. Price is $85 plus UPS.

Thanks to all that read this posting.
I am looking for information on how to construct a line frequency meter for the purpose of monitoring the output and aligmnent of generators. I would like it to be able to provide a linear voltage to indicate frequency at 110VAC. A generating set that is used at a local repeater site (10kw Kohler) has a standard needle type meter that reads out from 45 to 65 cycles. I have a vibrating reed type meter at this time, but would like to constructy a meter that can be permantly attached to the generator (I have mort that one genset). I know there can't be much to the circuit, but I don't know
where to start. (The simpler the better, less chance for trouble) Please respond via e-mail if possible.

Thanks & 73,
Josh KD6KML

You want a UPS "Uninterruptable Power Supply". Any computer store
will stock them these days. Basically this is a power inverter (sine
wave output on most), lead-acid battery, charger, and switching
ciucuit.

You be hard pressed to make this yourself for cheaper than they sell
them for.

<SNIP>

Cool Edit from Syntrillium. Does all kinds of fancy functions
including noise reduction. Needs massive computing power for some
functions (NR and filtering). S/W is about $50.

Resulting WAV files are unquestionably broadcast quality. It can
clean up HF broadcasts pretty well also (but not real time).

You'll need a good sound card for digitizing. Soundblaster and clones
are pretty noisy. I use a Tropez plus, which is probably the best for
$150 price range. Look at Turtle Beach for some high end cards.

A responsive microphone is a must. But remember you can remove noise,
so you can record in any reasonably quiet room. Good mics can be got
reasonable at most "chain" musician suppliers.

Get a CD-ROM burner and you can put your sounds on a CD that can be
played on any CD player and/or have the digital audio extracted
directly.

Sorry about the obnoxious salutation. I was actually very suprised myself to see the results. I knew modern rigs were crappy receivers connnected to high priced computers/tx- but I didn't know it was that bad.

I remembered that the early 1980's results were eye-openers, but had no idea it was so bad until someone told me that Mr. Sherwood had compiled results for the latest "high-tech???" rigs.

I guess when the whole shabang depends upon advertising dollars, just about any nutty position can be tolerated :)

Sorry to be 1/2 the messenger. Anyway there's lots of really good stuff on the Boatanchors group. And you can buy it for $200.

Rob.

# 1026. GPS antennae - Anyone know how to make one?

Newsgroup: rec.radio.amateur.homebrew

Cross-posted to: rec.radio.amateur,rec.radio.amateur.antenna,rec.radio.amateur.homebrew,rec.radio.amateur.space

Are there any hams (or non-hams) out there that have built or seen plans for a mobile GPS antenna? I have a Garmin GPS-40 GPS reciever with an external jack. An external antenna, I've found, is a requirement for reliable mobile GPS operation.

The GPS frequency is 1575.42 Mhz. The antenna needs to have enough gain to exceed coaxial cable losses (haven't selected a cable yet) and have resonably omni-directional response. I'm not sure, but I'd guess the satalite signal is horizontally polarized. I've wondered about a 1 turn helical and even a spiral on copper clad. Problem is I don't have equipment to test antennae at this frequency.

Thanks in Advance

It would be interesting to see equivalent figures for homebrew direct conversion receivers, particularly one made for high dynamic range (probably using a SBL-1 or similar) and an 'average' DC receiver (maybe using an NE602).

Down here there's less activity on the bands and our CW power limit is 120w on CW so there is probably less reason for dynamic range than in other countries. In this environment, my 40m direct conversion CW transceiver with an NE602 performs adequately.

Have you reseached the possibility of adjactent channel interference.
FM is a much wide mode of transmission than is AM.

# 1040. Calculating Air-Core Inductors

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-11 00:00:00 UTC
From: slug@bbs.aeminium.pt
Message-ID: <5q5iop$l2@pc2.local.aeminium.pt>
Source record: 92511
Cross-posted to: rec.radio.amateur.homebrew,pt.rec.radio.amadorismo

Hello guys. If you are reading this on a Portugues newsgroup, sorry for
any inconvinience - if you don't understand something email-me.

So, my question is. Is there a better formula than this one:
( grabbed from ARRL Amateur Handbook 1995 page 6.22 )

L ( uH ) = ( d^2 * n^2 ) / ( 18 * d + 40 * l )
where
L - inductance
d - diameter
l - length
n - number of turns

to calculate Air-Core Inductors?
Formulas for different frequency ranges would be nice too.

I'm making a xForms X based cute program to make some simple calculations
( for now ) and need good formulas.For now the program displays a
xy plot graph that shows the response of a RLC resonant circuit with
variable parameters ( R, L, C ) which can be changed trough simple
controls.Some values like ressonant frequency, circuit Q, bandwidth
are calculated and has 3 more controls that change the diameter,length and
nr of turns.
All these values & calculation results are shown in a little box with
slide controls.

The source is C and its my first interesting & usefull xForms program.
The program is working very well now, but i'll add some more things, like
a menu to choose betwen cms or inches and so forth.So when i have it
finished i will make the upload.
The system that i'm working now is Linux 2.0.30, xForms 0.86,
gcc 2.7.2, X11R6.
I don't have much time to make this program but when i finish my exams i
will try to finish it.

Thank you for your attention!

Hello!

I've updated my hardware page with some new boards.

http://www.esi.us.es/~melus/gwlelec.html

Some of what you can find there is:

Miscellany section
1.PIC16c84 PROGRAMMER via the PC printer port
2.PIC16c71 BOARD for AN557 plus 8 bit latched output port
3.8031 BOARD with 8K EPROM, 2K SRAM and RS232 untested!!
4.WB FM Receiver with TDA7000 and MONO AUDIO AMP
5.MODEM MANCHESTER 1200-38k4 bps (clock*64)
6.MONO AUDIO AMP with TDA2002

Enjoy!, and mail me your coments.

You fail to remember MOSt of the people who nixed your article and Handbook material had nothing to do with Ham radio manufacturing. The people published in the QST Technical Correspondence were people picked out of a stack of letters about an inch thick pointing out errors in your articles.

Two of the people were indirectly in the industry. I was one of those people ( I serve as a consulting engineer, and do some work for Ameritron and SEVERAL other amateur radio companies), and another was Reid Brandon (of Eimac).

Not that it's any of your business, but the majority of my income is from medical and industrial electronics and patent royalties. My true employer is C.T. "Tom" Rauch, he sets my hours and determines who I work for. You should try to get at LEAST one thing right when you whine in public.

Of the rest of the PUBLISHED contributors, one guy worked for NASA and another for a semiconductor manufacturer. Another worked for a non-amateur radiao related amplifier company out west.

You appear to be distorting facts badly, as anyone bothering to read the profiles in QST would know.

You also must know these few people, including myself, had nothing to do with the rejection of your Handbook material. That material was sent out to other people, and ALL of them returned unanimous "trash it" votes. One well known ex-Rockwell engineer who is published in engineering texts scrawled "don't waste your time with this" across the top and returned your article.

Instead of admitting the truth, you get in a public forum and publicly lie about who did what.

Of course some people will be gullible enough to believe you when you claim it was a personal grudge, while others will get out a few reference books and discover your articles were most likely rebuked because they were just plain incorrect.

The ARRL was VERY careful making sure they were wrong in printing your stuff, it takes monumental evidence to get them to retract anything they commited to publishing. Contrary to what you preach, it was many people... most not even involved with amateur radio in any way.... that nixed your articles.

They were nixed because they were nonsense, nothing more...nothing less. Claiming the ARRL is dishonest is just sour grapes, probably because your moment of fame ended when they FINALLY submitted your material for review. Their ONLY mistake was waiting until after they published you to do the technical accuracy check. That, and the way they handled the rebuttal, were the only flaws in the whole thing.

Try Protel Easytrax. It's free and has NO limitations at all. It is NOT a crippled demo. It is available for download directly from Protel. I don't remember the URL but try http://www.protel.com. If that doesn't exist, search for protel and easytrax on AltaVista.

Easytrax can produce output for a variety of printers, laser printers, plotters and Gerber/drill files as well. It is a DOS program. Protel released it to the public domain when they switched their products over to Windows.

# 1045. Taylor Modulation?????

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-11 00:00:00 UTC
From: k0qz@primenet.com
Message-ID: <5q4td1$56r@nntp02.primenet.com>
Source record: 92599

Does anyone in this newsgroup know how and why "Taylor Modulation" does what I remember being told it did? From What I can remember from the occasional mention of this AM modulation method in the late 50's and early 60's CQ and 73 magazines was that it was capable of up to as much as 400% positive modulation while keeping the negative modulation portion of the envelope below 100%.
Old handbooks and some old magazines have not given me any other information about this modulation method so I have no additional information. I understand that this is NOT hyesing modualtion but possibly used the same type of tube as the modulator (single ended) as the final amp used and worked very well... That is all I remember.
WHY?
Well, I was thinking about building an AM transmitter out of the mass of left over parts that I have managed to accumulate and thought it might make for an interesting conversation piece on the air if nothing else, so let me know what you know about it via e-mail and if you know where I can get some tech data on the method, please give me some input......

Thanks in advance.......Mike Baker K0QZ

A "flat" VSWR curve almost always means that there is *something wrong*
with your antenna system. The VSWR curve should show a pronounced
U shape as you plot it with respect to frequency. If it doesn't, I'd start
looking for the reason why.

Local groundwave range is one indicator that your antenna is working, but
you have to be careful on lower HF that you aren't looking at NVIS, IE
you're pumping your power nearly straight up and getting local coverage
via the near vertical return from the ionosphere. If you want maximum HF
range, you need to look at the energy you are directing at a low angle toward
the ionosphere. That's not easy to measure unless you have a field strength
meter equipped aircraft which can "fly the pattern" for you. So the next
best thing is to depend on reports from Dx stations. That can be confounded
by propagation factors, but it will give a useful indication of your pattern
if you keep a detailed log of the locations and reported signal strengths
of stations worked over a period of weeks.

NVIS generally doesn't apply in your case (CB), but it is something amateurs
operating on lower HF need to keep in mind. To check a CB antenna's pattern,
you can "run the radials" the way broadcast stations do. In other words, get a
friend with a mobile rig to go to various points around the compass from
your station, starting at one mile radius, and extending out to a 10 mile radius,
and plot signal strength readings on your station. When you plot signal contours
on a map from these readings, you'll have a very good idea how your antenna
is performing. When you make changes to the antenna system, run the radials
again and compare the contours with those you got on the first baseline run.
That'll tell you if your changes made an improvement or not.

...snip...
According to QST's Joel Klineman, N1BKE, the two people/copy-editors who nixed my 1995 ARRL Handbook manuscript were Dick Erhorn (Erhorn Technological Operations) and a person that Mr. Klineman said did not want for me to find out his or her identity. Eventually I discovered that the name/callsign of this person is Charles Thomas Rauch, Junior, W8JI. - So Messrs. Erhorn and Rauch have 'nothing to do with ham radio manufacturing'?

As I recall, a few months back, Mr. Rauch was firmly in charge of MFJ quality control and firmly in charge of MFJ engineering. :-). However, an even better laugh was the behind-the-scenes deal you tried to cut with me during the VHF parasitics debate to allow you to semi-gracefully exit. It was all over on 28 November, 1996, Tom---and you know it. Add a few ohms of ESR to Ls and VHF-Rp plummets. Wes' scientific measurements prove it. The series to parallel-equivalent calculations confirm it. ..... Your steed appears to be slightly deceased, Tom.

Now you can get new plans to build a Cable Descrambler System, US and UK plans.

This is not the origonal Radio Shack plan (now obsolete), but a choice of six new up to date plans designed to work on any cable box in any area. Just send me details of which cable box you have and in what area you reside as the plan needed will vary area to area, and you will be able to view all premium and pay per view channels.

It works on all Cable Tv Systems. The parts to make the box cost appoximately $15 (depending on the plan) and you can find them at any local electronic part supplier( US Residents will be supplied with radio shack part numbers). British Sky Cable descrablers cost approx 20 Pounds. Remember this is for educational purposes only, you still have to pay for the channels you view. I have to say that to protect myself for any liablity.

For the Plans just send $ 2 or 2 Pounds to:

Ed Hacker
409 Adams Street # 7
Hoboken, NJ 07030
USA

The reason I charge two dollars is for the stamp, envelop, and paper your plans are on. I am doing this for you not for me to make money. Lets get real you cant buy much for two bucks. I am not in this for the money but to get back at the cable companys that over charge people.

CABLE HANDBOOK ( Additional $2 )

Everything you ever wanted to know about cable boxes. Includes a cross reference list for upgrading your box using upgrade converts, cubes, plug-in activators and service code-generators. Also explains general cable operation, this handbook is very COMPLETE, a must have!

TURN ME ON!

Turn on all your premium channels with nothing to buy.

The Notch Filter

A notch filter allows you to selectively descramble channels. For instance, if HBO is on channel 7 and Cinemax is on channel 14 or pay-per-view is on 22, you may build a notch filter to descramble each of those channels. This method is fairly simple to build; However, it requires several more parts than the Fifteen Dollar Box. This system will work on your cable system, no matter what frequency your cable system operates on. A cable box is NOT

REQUIRED, and parts cost in the range of $25-30 depending on how many channels pay channels you wish to descramble. NOTE: I used channel 7,14 and 22 as an example. Your premium services may be on other channels and the notch filter can be built for whatever channel your premium services are on. (between the range of 2-22) Parts can be purchased from a electronics wholesaler/retailer in your phone.

The Gated Sync is the Grand Daddy of descramblers (in band and out band). It can be configured to operate on your cable systems frequency. This system is for the serious home electronics buff. It is a bit more complex to build; However, it sells for a lot of money. And, it will descramble EVERY channel.

SSAVI was created by Zenith, and used by many Zenith converters. The system is very difficult to build, but it will descramble EVERY channel, and also sells for a lot of money. Novices should not attempt to build the SSAVI system.

FREQUENTLY ASKED QUESTIONS

What is a Descrambler?

A descrambler is a device that restores the picture and sound of a scrambled channel. In most cases, ALL channels which are scrambled will be restored.

Are Descramblers legal?

YES! It is legal to build, sell, ship, use, and own a descrambler; However, when you use a descrambler, it is your responsibility to notify the cable company that you are accessing their signal.

Do I need a converter from my cable company?

In most cases NO. A cable ready VCR or TV will work.

Is it difficult to build a descrambler?

Turn me on, the Fifteen Dollar Box, the Oak converter and the Foil method are very simple methods! The instructions provide step by step instructions. No special skill or knowledge are needed. The Notch filter is still fairly simple. The Gated Sync is not for the beginner, it requires electronics knowledge.

Can I build more than one?

YES! You may build as many descramblers as you want! They are legal to sell and demand fairly high prices!

Just send me details of which cable box you have and in what area you reside as the plan needed will vary area to area
For the Plans just send $ 2 or 2 Pounds to:

I'm looking for the datasheets of the following transistors :

TP 2180
TP 2320

Is there someone who can tell me where I can find these on the web ?
The transistors are used in a poweramplifier from an old Pye transceiver
operating around six meters.

Please reply via email to pe1mix@amsat.org

Thanks al lot,

Harold....

If a "few years ago" means about 20 - 25 years ago, there was an article in Popular Electronics about just such a device. They were listing it as a way to listen to LOCAL avaition freqs and as a non interferance way to listen while riding on comercial aircraft. Tiz all I remember.....

I've had a lot of fun with this rig but am looking for some modifications. The stuff on the Norcal Page is old-- no new mods. In particular, I would like to increase the selectivity a bit. Perhaps use it as a foundation for a multiband / VFO unit etc. Anyone know of any active discussions?? Thanks, Travis WA2JJF

>Messrs. Erhorn and Rauch have 'nothing to do with ham radio manufacturing'?

No, I never reviewed your Handbook material. I did receive a copy of it to read from two independent sources, but the actual reviewers were several other people OUTSIDE the amateur radio industry. An example of how you "twist things" can be found by reading the actual byline of the QST Technical Correspondence.

As I said, most of the people who nixed your article and Handbook material had nothing to do with manufacturing. QST tried real hard to find independent sources, and the author and moderator of the Technical Correspondence column had nothing to do with amateur radio and wasn't known to any of the dozens and dozens of people who wrote to complain about the misinformation in the article.

The only reason why I made the Technical Correspondence pages was because I found more mistakes than most people. Many people found errors in the area they specifically delt with (i.e. semiconductors or tubes), but since I deal with many types of HFPAs on a daily basis I was in a better position to find the most mistakes.

It was kind of like finding the most Easter Eggs hidden in the bushes, hi.

I'm sure it would behove your home business of selling mods to blame it on the manufacturers or the ARRL, but that's just your pecuniary interests talking. The truth is in print, for all to see.

The ARRL's only mistake was not reviewing your material before granting you magizine space for theories that rival those about Elvis and the aliens following Hale-Bop.

Nice try though.

73 Tom

As I recall, you also denied what took place when you telephoned me after "Parasitics Revisited" was published in QST. As I recall, you also denied that the information I obtained from the Eimac personnel dept. on the alleged "R+D Engineering Manager" was real. You promised to publish a letter from Eimac setting the record straight. So far, zip. Next came the alleged Eimac Technical Bulletins on parasitics, which also never materialized.

Some folks tell the truth and some do not. Self-recognized "experts" (9/94 QST, p.72) seem to fit in the latter catagory.

I recall that article, although I've long since lost my copy of it. As I recall, it was just a tuned circuit, followed by a simple amplifier. No local oscillator, hence no source for rfi that might cause problems with receivers in an airplane. The tuned circuit used a varactor as the capacitative element, and a pot controlled the voltage fed to it, allowing tuning over the range of 108-136mHz, or thereabouts.

Although it didn't have an oscillator, and shouldn't pose a problem for aircraft electronics, how would you ever convince the pilot?

The best you can do, without pulling a vacuum, is to simply use still
air as insulation. This is accomplished by making a "knife edge" support
structure out of PC board matl (w/o copper) or other plastic, such that
the conductive heat loss is negligible. Most plastics have 10 times the
thermal conductivity of still air, so that gives you an idea of what
you need to do. The thermal conductivity of still air is about 0.04
in MKS units, which have dimensions of watt-meter/degree C. You can
get low density polyurethane foams that are almost as good as still air.
For that matter, plain ordinary styrofoam is not all that bad. Perhaps
your expectations are unrealistic.

There are exotic insulations such as aerogels, glass spheres, and a
product called "min-K" that allow you to get below .04, but only if
you pull a vacuum, which I assume is not an option. You may want
to read my paper "The Theory of Zero Gradient Crystal Ovens"* for some
general ideas on ovens.

Heathkit Radios for sale!

I have four (4) radios for sale. Two are close to
working, 2 I havn't been able to get anything to happen.

SB-101 All tubes. Cosmetically good. 400 kc CW filter.

SB-101 All tubes. Very clean. 400 kc CW filter
Some audio & Receive. No Xmit.
I think this one just needs a good tune-up.

HW-101 All tubes. Very clean. 400 kc CW filter.
Receives but need tuning.
Transmits but needs tuning.
This may be the best one of the bunch.

HW-101 Most tubes. Seen better days. No filter
Havn't even tried to get this one going.

One HP-23 and Two HP23A power supplies, all working..

Box of spare LMO's, feet, dial parts, tubes, etc.

I'm selling all of above as package for $100.00 plus
shipping. The CW filters I know alone have been going
for $40-$50 each on the used market.

If intrested, please contact Shane, WB2WPM at:

(716) 675-5797
or sbrady@pce.net
or wb2wpm @ke2vw.#wny.ny.usa.na

I'm located outside of Buffalo, New York.

If your a fixer-upper and good with tubes radio's I
know you'll be able to get 2 of these up and running
in no time. The other 2 maybe too.

Thanks for reading, and hope to hear from you.

73, Shane WB2WPM

Rich,

You claim you called Eimac and you were told Miklos (who disagrees
with you, and who you wanted to discredit) was never R and D
Engineering manager. Yet Eimac's policy, as is the policy of most
major and small corporations, is not to release ANY employee
information to total strangers over the phone.

I do have a letter here, signed by Eimac's personal director, that
Miklos was indeed R+D manager. To get that letter it was necessary to
have Buzz send Eimac a written statement authorizing release of his
employment history, because that is the firm policy of most employers
and the absolute policy of Eimac-Varian.

IMHO, if someone makes a mistake about one simple telephone
conversation he likely makes mistakes about many other things... as
you did with Marv Borne's "alleged" Al-1500 and other things like a
TL-922 that YOU KNEW was a antenna lightning arrestor failure you
blamed on a parasitic, and the owner "happened" to pop up and rebuke
your claims. You also made a mistake about Eimac telling you
parasitics caused grid problems in low power tubes, mixing a single
problem suspected in a UHF high power televison transmitting tube into
an 8877.

I believe you honestly think you hear what you claim to hear. That
does not mean, however, it really happened.

Hi all,

I have now added a QRP linear amplifier to the collection. It was designed as the final stage for my Phasing-type SSB exciter, but with over 30dB of gain it will make a lovely CW / SSB transmitter when used with a simple oscillator / driver. I have used it at 10 watts with my Grid Dip Oscillator (GDO) as a driver.

The hand-drawn PCB foil pattern is also included as a GIF file (drawn before I ever had a PC computer).

I am adding more circuits to my homepage constantly, as long as I have time available to do it. Have fun with QRP (and QRO).
Harry, SM0VPO (G4VVJ), Upplands V&#65533;sby, Sweden.

The Volusia County ARES/RACES Page is back up and operational!

The New Address is:
http://www.netpass.com/varecs

This page was down for awhile at an older address. The old address is not operational. If you currently have a link to VARECS at the former address (dbeach.com) please change it to the above (netpass.com). If you have taken down the link please put the new one up at your earliest convience.

Some new features include:
+ Frames
+ Image Maps
+ Music
+ Updated Links
+ The Amateur Radio Ring
+ And Many More Great Improvements

I invite everyone to check out our new page. Please spread this message to any newsgroups, mailing lists, packet BBS or any other meathod you see fit. If you have a or know of any ham radio pages, newsgroups, or any other information, that isn't on our link list please send them to kf4bia@n-jcenter.com. Personal pages are welcome along with skywarn, ares, races, civil defence, and any other ham radio related pages.

Thanks,

... I have a coil calculator that was found while searching the QRP - homebrew pages - (I don't remember where). Try:

(Insulated14 ga wire diameter estimate 0.072")
On 1 inch form, average winding depth 1.375", length 3.8 "
520 turns total gives L = 2 mH.

R should be about one half ohm.

Disclaimer: I have not *actually* built a coil from this calculator or know it's
accuracy.

# 1085. Re: Comb Generator versus Marker Generator

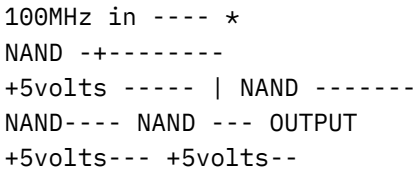
Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-14 00:00:00 UTC
From: tomb@lsid.hp.com
Message-ID: <5qecil$phg@hpcvsnz.cv.hp.com>
Source record: 92458

John Kolb (jlkolb@sd.cts.com) wrote:

(On generating a "comb" of marker frequencies:)

: Take the sq wave, and connect it to one input of a 74AS00 gate and
: also to an input of an inverter, a 74AS04, or another section of
: the 74AS00 with the inputs tied together. Tie the output of of the
: inverter to the other input of the 74AS00. Most of the time, input
: A will be high and B low or vice versa, and output Y will be high.
: Only when the oscillator switches from low to high, A will be high,
: and B will still be high because of the delay of the inverter will
: the output go low. Thus a narrow spike is created. It may be necessary
: to put 3 inverters in series to get the proper delay for this to work.

An infinitely narrow impulse repeated periodically will have a
spectrum of equal amplitude harmonics of the repetition frequency.
They extend out "forever" in frequency. If the pulse has width, the
comb will be multiplied by a sin(x)/x factor (assuming rectangular
pulses) which "zeros" the harmonics out far away from the fundamental.
The wider the pulse, the closer in the nulls come in the frequency
domain. So...to make harmonics out to as high a frequency as possible,
make the pulses as short as you can. Use a logic family with very fast
rise and fall times (ACT type stuff?? I'm not up on the fastest logic),
and use a single quad two input package like John suggests for all
the gates, so you don't have to worry so much about ground bounce.
Minimize the loading on each gate, to get the fastest possible rise and
fall times: keep leads very short, and minimize the number of inputs
each output drives, like so:



Note that there's an input buffer which gives fast edges to
next stage; "inverter" has one input tied high instead of
two driven inputs; output buffer may not be any advantage.
My experiments say a single NAND delay is plenty...more like
too much. You can put a small resistance in place of the wire
labeled with * to further shorten the pulse width by making the
inverted and direct paths more nearly equal. The resistance
causes a delay by virtue of the input capacitance of the third
NAND, which should be in the vicinity of 3pF, so resistance in
the low hundreds of ohms would be appropriate. "Dead bug" wiring
over a ground plane should work well for this.

--
Cheers,
Tom

I agree with the comments on still air, with the emphasis on still.
Some light material can help reduce loss through convection currents
and you can do much worse than dry paper matrix in this respect. Try
putting some news print through the liquidiser, but don't cut it up
too small,or pack it in too tight.
Adrian, G4AZS.

I live on the Kentucky river , Trying to come up with a 2mtr antenna
design that can hold up to the elements (trashed my whip on a tree
branch yesterday ) !
question >would a screen door spring (non painted) work as a ground
section of a center fed whip , or eaven as a driven element ?
Seems like as long as the coils are shorted together the electrical
length would be as if it were solid ?

Any Ideas E-mail me .

Thanks

# 1090. $$$$$$$ LOAN BUSINESS, EASY MONTHLY INCOME, NO BRAINER $$$

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-14 00:00:00 UTC
From: a9@a.a
Message-ID: <33c97bd8.0@news.unibe.ch>
Source record: 92544

I have participated in the standard "Please put me on your mailing list" letter and found it to be worth
my time (I get 1 or 2 handfulls or letters every day) but I also found that it's results were nowhere
near what I expected due mainly to people not sending in the money but rather spreading the letter
without paying for it. I participated in that mainly as an experiment and found that there are a
tremendous amount of people willing to do it. I thought about how to, first, eliminate the "non-pay"
problem and, second, to create a monthly income. I came upon the solution and decided to start a new
program. I decided that there were 3 things that this new program needed in order to work for everyone
and they were: 1.) It needed to be very simple and easy for anyone to do, and, 2.) It needed to be
inexpensive enough for even the poorest of people, and, 3.) It needs to be DUPLICATABLE. I think you
will find this program to meet those requirements. I have put lots of thought into it and I ask that you
PLEASE do NOT modify it. This WILL WORK if you follow it. This system is based on the unconditional
"loaning" of money to people. Simply say, "I am loaning you this $2 as an act of goodwill to help you in
your financial need, you may pay me back if and when you can." You should find 5 or more people who will
send $2 to the 5 needy people on this list AND MAINTAIN 5 or more people who will do the same. You
should put your name on postition number 5 and move each of the other names up one position. The name
originally on position number 1 gets removed. You should be able to contact each of your 5 or more
people to see if they are going to be active this month. If not then you need to find one or more people
to be active in order to maintain at least 5. I am not speaking about the 5 people on the list but
rather the 5 new people you have found. I would highly suggest having more than 5 in any given month.
Now I know that this would be extremely easy to do since I can think of at least 20 people myself who
will do this consistently. The key is to maintain at LEAST 5 active people. If you don't then you can't
expect for the rest of the people to do it either and you can't expect for this system to work. This

system is a no-brainer, and if someone can't afford the $10 + stamps for this then they truly ARE in
need! It is OK to use the internet to find people but I think it would be easier to find them through
people that you know. This way it will be easier for you to contact them every month to ask about their
being active, unless someone is willing to give you their e-mail address. Here are some numbers:

---

Monthly income model per level and total for maintaining 4 active members @ $2 each:

Level 1: $2 x 4 people = $8, Total now $8
Level 2: $2 x 16 people = $32, Total now $8 + $32 = $40
Level 3: $2 x 64 people = $128, Total now $8 + $32 + $128 = $168
Level 4: $2 x 256 people = $512, Total now $8 + $32 + $128 + $512 = $680
Level 5: $2 x 1024 people = $2048, Total now $8 + $32 + $128 + $512 + $2048 = *** $2728 ***

Yearly income: $2728 x 12 months = $32,736

---

Monthly income model per level and total for maintaining 5 active members @ $2 each:

Level 1: $2 x 5 people = $10, Total now $10
Level 2: $2 x 25 people = $50, Total now $10 + $50 = $60
Level 3: $2 x 125 people = $250, Total now $10 + $50 + $250 = $310
Level 4: $2 x 500 people = $1000, Total now $10 + $50 + $250 + $1000 = $1310
Level 5: $2 x 2500 people = $5000, Total now $10 + $50 + $250 + $1000 + $5000 = *** $6310 ***

Yearly income: $6310 x 12 months = $75,720

---

Monthly income model per level and total for maintaining 6 active members @ $2 each:

Level 1: $2 x 6 people = $12, Total now $12
Level 2: $2 x 36 people = $72, Total now $12 + $72 = $84
Level 3: $2 x 216 people = $432, Total now $12 + $72 + $432 = $516
Level 4: $2 x 1296 people = $2592, Total now $12 + $72 + $432 + $2592 = $3108
Level 5: $2 x 7776 people = $15552, Total now $12 + $72 + $432 + $2592 + $15552 = *** $18660 ***

Yearly income: $18660 x 12 months = $223,920

---

Monthly income model per level and total for maintaining 7 active members @ $2 each:

Level 1: $2 x 7 people = $14, Total now $14
Level 2: $2 x 49 people = $98, Total now $14 + $98 = $112
Level 3: $2 x 343 people = $686, Total now $14 + $98 + $686 = $798
Level 4: $2 x 2401 people = $4802, Total now $14 + $98 + $686 + $4802 = $5600
Level 5: $2 x 16807 people = $33614, Total now $14 + $98 + $686 + $4802 + $33614 = ***

$39214 ***

Yearly income: $39214 x 12 months = $470,568

---

Keep in mind that it does not matter what day of the month that someone chooses to be active. It DOES
matter that they are active on that day EVERY month. The key to this is DUPLICATION! You must treat this
as a business. If you treat it like a hobby that is how it will treat you. You could even organize small
meetings with your people and their prospects and work with your leaders.
Think of how easy this would be for you, how reasonable this is, and of how good the chances are of it
working for you. You may need to hire someone to open all the envelopes.

NOTE: I decided on $2 instead of $1 because it is more feasible and it won't matter much for someone to
send $2 as opposed to $1. Also I was against $5 as that becomes too expensive to duplicate.

Mail $2 every month with a piece of paper saying "I am loaning you this $2 as an act of goodwill to help
you in your financial need, you may pay me back if and when you can" to the following needy people:

"loaning" of money to people. Simply say, "I am loaning you this $2 as an act of goodwill to help you in
your financial need, you may pay me back if and when you can." You should find 5 or more people who will
send $2 to the 5 needy people on this list AND MAINTAIN 5 or more people who will do the same. You
should put your name on postition number 5 and move each of the other names up one position. The name
originally on position number 1 gets removed. You should be able to contact each of your 5 or more
people to see if they are going to be active this month. If not then you need to find one or more people
to be active in order to maintain at least 5. I am not speaking about the 5 people on the list but
rather the 5 new people you have found. I would highly suggest having more than 5 in any given month.
Now I know that this would be extremely easy to do since I can think of at least 20 people myself who
will do this consistently. The key is to maintain at LEAST 5 active people. If you don't then you can't
expect for the rest of the people to do it either and you can't expect for this system to work. This

system is a no-brainer, and if someone can't afford the $10 + stamps for this then they truly ARE in
need! It is OK to use the internet to find people but I think it would be easier to find them through
people that you know. This way it will be easier for you to contact them every month to ask about their
being active, unless someone is willing to give you their e-mail address. Here are some numbers:

---

Monthly income model per level and total for maintaining 4 active members @ $2 each:

Level 1: $2 x 4 people = $8, Total now $8
Level 2: $2 x 16 people = $32, Total now $8 + $32 = $40
Level 3: $2 x 64 people = $128, Total now $8 + $32 + $128 = $168
Level 4: $2 x 256 people = $512, Total now $8 + $32 + $128 + $512 = $680
Level 5: $2 x 1024 people = $2048, Total now $8 + $32 + $128 + $512 + $2048 = *** $2728 ***

Yearly income: $2728 x 12 months = $32,736

---

Monthly income model per level and total for maintaining 5 active members @ $2 each:

Level 1: $2 x 5 people = $10, Total now $10
Level 2: $2 x 25 people = $50, Total now $10 + $50 = $60
Level 3: $2 x 125 people = $250, Total now $10 + $50 + $250 = $310
Level 4: $2 x 500 people = $1000, Total now $10 + $50 + $250 + $1000 = $1310
Level 5: $2 x 2500 people = $5000, Total now $10 + $50 + $250 + $1000 + $5000 = *** $6310 ***

Yearly income: $6310 x 12 months = $75,720

---

Monthly income model per level and total for maintaining 6 active members @ $2 each:

Level 1: $2 x 6 people = $12, Total now $12
Level 2: $2 x 36 people = $72, Total now $12 + $72 = $84
Level 3: $2 x 216 people = $432, Total now $12 + $72 + $432 = $516
Level 4: $2 x 1296 people = $2592, Total now $12 + $72 + $432 + $2592 = $3108
Level 5: $2 x 7776 people = $15552, Total now $12 + $72 + $432 + $2592 + $15552 = *** $18660 ***

Yearly income: $18660 x 12 months = $223,920

---

Monthly income model per level and total for maintaining 7 active members @ $2 each:

Level 1: $2 x 7 people = $14, Total now $14
Level 2: $2 x 49 people = $98, Total now $14 + $98 = $112
Level 3: $2 x 343 people = $686, Total now $14 + $98 + $686 = $798
Level 4: $2 x 2401 people = $4802, Total now $14 + $98 + $686 + $4802 = $5600
Level 5: $2 x 16807 people = $33614, Total now $14 + $98 + $686 + $4802 + $33614 = ***

$39214 ***

Yearly income: $39214 x 12 months = $470,568

---

Keep in mind that it does not matter what day of the month that someone chooses to be active. It DOES
matter that they are active on that day EVERY month. The key to this is DUPLICATION! You must treat this
as a business. If you treat it like a hobby that is how it will treat you. You could even organize small
meetings with your people and their prospects and work with your leaders.
Think of how easy this would be for you, how reasonable this is, and of how good the chances are of it
working for you. You may need to hire someone to open all the envelopes.

NOTE: I decided on $2 instead of $1 because it is more feasible and it won't matter much for someone to
send $2 as opposed to $1. Also I was against $5 as that becomes too expensive to duplicate.

Mail $2 every month with a piece of paper saying "I am loaning you this $2 as an act of goodwill to help
you in your financial need, you may pay me back if and when you can" to the following needy people:

# 1093. ++++NEED HELP WITH RC CIRCUITS++++

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-14 00:00:00 UTC
From: hq54@aol.com
Message-ID: <19970714142101.KAA23283@ladder02.news.aol.com>
Source record: 92547

Hi,

I know that an RC circuit is a resistor and capacitor, and I believe that it can be used to delay a voltage from reaching a certain point after the RC circuit, or that it can be used to lengthen the time that a voltage remains in a circuit after the RC circuit. I have a power supply feeding current to a transmitter. This current is for control purposes only. The transmitter is fed by a seperate dedicated supply, but the control currents (there are 2), when there, key the transmitter, and when not there, the tranmitter is unkeyed. I would like a circuit that I can use to lengthen the time that the control voltages are present on the 2 control wires, one feeding 9.5 volts, and the other 12.5 volts. The delay should be between 2 and 3 seconds. If you can help me with this type of circuit, and/or provide me with the equation to figure out the delay as a function of resistance and capacitance, please let me know by E-Mail.

Thanx
Mike

# 1096. Barebones Superhat @ N2CQR

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-14 00:00:00 UTC
From: wmeara@erols.com
Message-ID: <33c9fa0f.831948@news.erols.com>
Source record: 92550

Homebrewers: I got my version of the Barebones Superhet (June 82 QST) finished this weekend. It really sounds great. Compares very favorably to my Drake 2-B and the receiver in my HW-101. VERY stable. I'm using one 3.579 mhz crystal as the IF filter. A bit broad for CW, but it makes the SSB signals sound wonderful. I can now swing the VXO rocks about 20 Kc and I have crystals to tune 14.031-14.051 and 14.195-14.217. EA3OT from Barcelona fills the room with FB SSB audio. Building and using my first HB transmitter was a real thrill, but I think that the satisfaction that comes from listening to this little reciever is even better. I should be making QSOs by next weekend.

I have a few little problems. Maybe someon i nthe group could suggest solutions.

Sluggish VXO: It runs fine once it gets oscillating, but every now and then when I turn on the receiver, the VXO doesn't start oscillating until I touch the crystal. Seems like it needs a little pus to get it going. Any ideas?

WIAW in the IF. I'm wondering if the selection of the 3.579 IF wasn't part of some ARRL plot! (Just kidding!) While tuning 20 meters, I can hear (faintly) WIAW's 80 meter bulletins and code practice coming through. I suppose a simple bandpass filter would help...

Thanks, 73 Bill N2CQR

# 1099. Pioneer HiFi - need to modify to use a mic'

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-14 00:00:00 UTC
From: N.M.Marsh1@student.derby.ac.uk
Message-ID: <5qc63c$ili@unix3.derby.ac.uk>
Source record: 92553

I have a Pioneer Hi Fi (circa 1989) system and would like to make microphone recordings on the twin Cassette Deck (CT-Z 360 WR), however there' no facility to do so. The only connection on the deck is a 28 pin ribbon cable that goes to the amplifier (A-Z 360).

Can someone advise me the how to modify the unit ?.

Given the details I'm competent enough to make up a circuit and install it myself.

If it helps the Laser Disc & VCR left/right input phono sockets on the rear of the amp are not used.

A recommendation for microphones of reasonable quality and price will be useful too.

Thanks in anticipation of your response.

Neil Marsh

## 1100. CR-1A/AR xtal sockets

Hello, this is Harry Miller KB6CGG in California. The sockets
I am looking for have a 1/2" pin spacing and the pins are
1/8" or .125" diameter. I have found 3, but, need more. If
you have any or know where I can get some, please let
me know via email hk@fix.net tnx es 73 Harry

## 1101. Need help making chokes

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-14 00:00:00 UTC
From: voicebox@dnai.com
Message-ID: <voicebox-1407971141510001@dnai-207-33-180-161.dialup.dnai.com>
Source record: 92555
Cross-posted to: rec.radio.amateur,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I need help making a couple of 2mH air-core chokes. This is for an experiment with audio frequencies and currents, so I need to make them out of stout wire (probably 14ga solid copper, insulated). They need to be somewhat adjustable by hand (spreading out the coils).

Can someone give me some dimension guidelines for these? It will be easy to know when they are tuned (waveform on the o'scope will peak, so say the instructions), so great accuracy isn't required.

I am a non-radio electronics amateur who knows the consequences of breaking ohms law :-)

Any help will be greatly appreciated. Direct e-mail replies, doubly so.

Thanks.

Enjoy,
Dave

# 1107. Scavanged OLD radio, SSB Filter(?)

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-15 00:00:00 UTC
From: maroof@triton.kaifnet.com
Message-ID: <33caaa07.3226359@news.kaifnet.com>
Source record: 92467
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.design,sci.electronics.components

Found this in an old SSB radio. I think it's some kind of an SSB filter set. It has two parts:

1. VERNITRON
TL-720-2
7605
...This is a three terminal component, looks like a double ended electrolytic capacitor with the body acting as third terminal.

2. Vernitron
TF 720-2
... This is a 2 terminal component, looks like a ceramic resonator.

In the original circuit board, part(2) was connected terminating one end of part(1).
Can anyone give any idea what kind of filter this is, How to use it, any specs?

## 1108. IF amp specs

Newsgroup: rec.radio.amateur.homebrew

Hi,

I'm looing for specs or data sheets of PLessey SL612C & SL610 IF amplifiers.
Looking for something close of enough to replace them.

Maroof

# 1109. Looking for DTMF keypad

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-15 00:00:00 UTC
From: voicebox@dnai.com
Message-ID: <voicebox-1507970751210001@dnai-207-33-180-161.dialup.dnai.com>
Source record: 92469
Cross-posted to:
sci.electronics.repair,sci.electronics.design,rec.radio.amateur.homebrew,rec.radio.amateur.misc,comp.dcom.telecom.tech

I need a DTMF (i.e. telephone) keypad. The 12-key keypad needs to be self-contained (all electronics within the borders of the keys, not spread out on a circuit board larger than the keypad itself). It must be able to be powered from the telco line power; no room for batteries.

Any suggestions? Do you know of any keypads from some telephone/ radio equipment you've seen that might fit my needs? I'm upgrading an old dial-type telecom test set to a tone-type, and the keypad needs to fit within the space that the dial takes up.

Thanks for any help you can offer. Direct e-mail replies are doubly appreciated.

Enjoy,
Dave

Hi my name is cory
I have wanted to have a shortwave radio station for a long time. So I figured now's a good time if any. SO. Here I am. BUT I HAVE NO IDEA HOW TO GET STARTED. Actually my brother and his friend use to have a radio station but it was ostly his friends equipment

Any way.
I just want to know how to get started. Buy some cheep equipment stuff like that.
THANKS

CORY

If you're going to use this radio on 11 meters, it's not legal
for you to modify it. However, if you want to add a little
kick, check out Harry SM0VPO's home page -- he has a nice
10-watt linear amp that should fit inside that chassis.

Harry posts the URL for his page pretty frequently.

Hi Cory -- if you mean "How to get started in Ham Radio" see URL:
http://pw2.netcom.com/~ac6v/pageA.html#H
license required

If you mean CB see URL:
http://pw2.netcom.com/~ac6v/pagej.html
no license required

Except for very very low power operation,
other "shortwave stations" require a license -- see FCC Pages.

Regards
Rod in San Diego

Hi Thanks for reading,
I am looking for mods for my kenwood/trio TR751e,
what i would like to do is to get it to rx below 144.00
i have got the display to read 140 to 150 but it only rx,s from 144 to 150
dont know why?? the display shows a small minus sign when trying
to tune below 144 mhz !!
any help would be of great use ....73s DE dave Gw7pny

# 1118. Classes D,E,F,G,H Amplifiers

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-15 00:00:00 UTC
From: Matt Ettus <mne@cmu.edu>
Message-ID: <33CBBDB1.7DECA023@cmu.edu>
Source record: 92478

Hi. After reading the recent QST article on the Class E amplifier,
I decided to do some research on other classes.

I understand A,B,C, and E.

There seems to be disagreement on Class D, however.
One reference says it is just a push-pull with two class C halves, fed
by a square wave.

The other reference I have says it is PWM, and can reproduce linear
signals. This one was an audio application.

Also, does anyone know what classes F,G,H, etc. are?
How about any references to learn more about them?

Thanks
73

Source record: 92479

Hi all,

I have now added a QRP linear amplifier to the collection. It was designed as the final stage for my Phasing-type SSB exciter, but with over 30dB of gain it will make a lovely CW / SSB transmitter when used with a simple oscillator/driver. I have used it for 10w with my Grid Dip Oscillator (GDO) as a driver. The hand-drawn PCB foil pattern is also included as a GIF file (drawn before I had a PC computer).

I have also added a dead easy 15v PSU. No IC's or any complicated stuff. Can be extended to form a regulated 0-15v PSU with current limiting (only two active devices).

I am adding more circuits to my homepage constantly, as long as I have time available to do it. Have fun with QRP (and QRO). Harry, SM0VPO (G4VVJ), Upplands V&#65533;sby, Sweden.

Source record: 92481

Yes, you can generate a mighty flat comb spectrum using a high
amplitude narrow pulse. Remember that it's still a high amplitude
pulse. It can fry the mixer diodes in your spectrum analyzer even
though each harmonic is within specified dynamic range. It also takes
very little DC offset to fry diodes.
BE CAREFUL

# 1125. Re: Help, filter oven

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-15 00:00:00 UTC
From: hamm4fun@aol.com
Message-ID: <19970715150101.LAA07288@ladder02.news.aol.com>
Source record: 92485

The problem with your oven may not be insulation but rather a lack of thermal mass. The idea behind using a oven is to stablize temp by raising it above the ambient. Assume for the moment that your insulation is nearly perfect, now you would not only have to have a heater to raise the temp of the oven but also have to deal with cooling the device to maintain a stable environment.energy
I recently disassembled a small crystal oven used as a frequency standrad.(Heating element went out). this device had very little insulation but the temp sensor and the heating element were encapsulated in a small "concrete appearing" cylinder that surronded the crystal. I had used it for several years as a frequency standrad at 10Mhz occasionally having to adjust the osc to allow for aging of the crystal. Short term{24 hr) stability of the osc was at least 1 part in 10 million.(I cant measure more accurrately than this).
An oven with enough thermal mass may not require insulation at all. The only real advantage of the insulation would be to conserve energy applied to the heater.(Are we talking about more than 5 Watts?)The unit I disassembled had only a thin layer of cork wraped around the outside of the heater.
If your requirements are really tight I suggest you use some type of proportional control for your heater. The on-off type of control of a thermostat would not be acceptable in critical conditions.

## 1126. Transformer specifications

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-15 00:00:00 UTC
From: cas@marconi.ih.lucent.com
Message-ID: <5qgf6k$foa@ssbunews.ih.lucent.com>
Source record: 92486

Hi all.
Im building a 1.2G amp from the 1991 handbood. It needs a 1200 volt
supply at about 400mA peak. I have an OLD transformer that is about the
right voltage (950VCT AC) but I dont know the current rating. This xformer
is 3.5x4x6 and also has one 5V and two 6 volt windings. It is completely
sealed in a square metal can with ceramic insulators. It was originally
used with a 5R4 rectifier tube and a pi type filter (cap,choke,cap).
I would need to use it in a bridge circuit to get the required voltage.

How can I determine its current rating?? Can I get a good idea by measuring
the AC voltage drop under load? Or do I have to connect some rectifers
and filter caps and measure the DC performance?

Thanks

chuck sherwood

Back in '65, I built a dual 6146 plate modulator and stuck it on
a Viking challenger. Big resistor in series with a string of diodes
across the plate modulation transformer. Negative peaks get dissipated
in the resistor, positive modulates big-time. Used a lot of clipping
too to keep those peaks humming. Worked like a champ. Don't remember
all the details, but think the challenger ran 60W input and the
modulator
ran 240W input.

*** !!!! WE ARE BACK IN THE GARAGE !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
July 20th, 1997
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >1000 cars!

Buyers admission is $4 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Seperate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)

Harvard Wireless Club (W1AF)

What does everyone think about Ten-Tec's 6-meter/2-meter/220 mhz transceiver kits? How do they compare to commercial rigs? Are they a good value? Are they difficult to assemble?

Find the nearest yard sale. I saw telephones for $5.00 a couple of weeks
ago. Each one had such a thing in it. The "500" set conversions actually
could accept either dials or touch tone keypads.

Some things you might look at --

o Will the winding resistance pass the required current? Check
both the primary and the HV secondary.
o Does it REALLY look like a 500-watt transformer? The handbook
used to have a lamination size estimator that plotted
core cross-section against output wattage (saturation).
I'm not sure whether they still include stuff on
rewinding transformers any more.

You could connect the secondary to 110V, load down the
primary with car headlights, and measure current&volts to
see what you get in watts. A headlight is approx. 100 watts.

Or you could build the supply and test it on the air (hihi),
but I suspect your max output power may be disappointing. But
assuming the components you used were all capable of handling
400 mA at 1200V _except_ the transformer, you'd only need
to locate a transformer later. And this is a fairly common
swapfest transformer voltage.

I have seen some seriously cobbled-together junk used as
plate supplies on HF amps, and it worked fine when it
wasn't pushed too hard. If you can live with a working,
lower power amp -- as opposed to a non-working high-power amp
-- you may be able to use a too-small transformer.

If your final is a 2C39, they're not real efficient and you
will need a solid 500 watts in to see anything like 100 watts out.
But you COULD get 25 to 40 watts out, and the dB difference
between 25 and 100 isn't that much.

: pulse. It can fry the mixer diodes in your spectrum analyzer even
: though each harmonic is within specified dynamic range. It also takes
: very little DC offset to fry diodes.
: BE CAREFUL

Mike's advice is well worth heeding... Don't throw out the baby with the bathwater, though: a capacitor will remove the DC, and an attenuator and/or bandpass filter will knock the peak amplitude down nicely. From 5-volt logic, the max pulse amplitude should be 5 volts, and for an extremely narrow pulse will be less than that. (There are ways to generate 100 volt sub-nanosecond pulses that would be really dangerous to mixers!) I'm assuming the markers don't have to be very big to be useful, and a 20dB attenuator is probably appropriate at the comb gen output.

Source record: 92500

I think the info you need is in the arrl handbook. You can estimate the power rating of a xfmr if you know the size of the core. Barring this method, Load the output of the xfmr until the ouput voltage drops by 10% of the noload voltage and measure the current. Practice saftey when doing this voltages may be lethal.

> ran 240W input.

Taylor modulation is one of the many forms of efficiency modulation cooked up in the thirties and forties to reduce audio power requirements of medium and high power broadcast applications. The Taylor circuit (as I remember it) consisted of two RF amplifiers, one operating in some mode of efficiency modulation, probably grid or screen, and the other operating at far cutoff and only turned on during the positive audio peaks. The outputs are combined and the resulting carrier appears to be modulated -100%/+400%. Since the first amplifier is efficiency modulated, the carrier output is one fourth what it normally would be in class C. On positive peaks the first amplifier is delivering full output which is added the the full output of the normally cutoff amplifier.

Taylor modulation is strongly "upward" resulting in significant
"pumping"
of receiver AGC unless the time constant is long. KFI (640KHz) tried
Taylor modulation for some years, and I believe their old standby rig
may still be modulated that way... Saves tons of iron!

Try a 1-2 MOhm resistor in parallel to the crystal. This way the
oscillator doesn't depend on the crystal to start.

Hope that helps,

## 1144. ten tec kits

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-16 00:00:00 UTC
From: psyodell@mail.provide.net
Message-ID: <33cd5f7d.957123@news.provide.net>
Source record: 92504

I have just built the Ten Tec 40 meter QRP rig. I just can't get any gain out of the receiver, unless I jump the crystal filter, and then it isn't anything to write home about.

I have spent about 300 hours checking the construction, and, heaven knows, I may have some solder bridges that my ohmmeter hasn't picked up.

I almost never post anything, but this one has really stumped me. All the xtals are ok, all the components check out, there are no shorts that I know of. Ten Tec is helpful, and I've replaced all of the semiconductors in the RF chain.

Oh, I get gangbusters performance from the 11 mhz IF.

I just hate to give up. 73 Jerry W8GND

We did some studies of air insulated ovens and found that convection currents
were negligible in terms of oven power consumption. We also found that
radiation loss was also negligible, reaching maybe 5% of conduction loss
if you paint everything black.

It is not clear from the original posting whether the complaint is
excessive heater power consumption or poor "thermal gain" (which is
defined as the ratio of a change in ambient temperature to the resulting
change in oven temperature.) If the problem is thermal gain, then you
are right, that insulation is not the main issue and that one brute
force fix is to make thermal mass bigger.

The curreent handling is limited by the temperature rise. You can connect
the anticipated load for the anticipated amount of time. If the transformer
becomes only warm, you are OK, if it becomes hot (and smelly) it wont do
it. The voltage drop at full load depends very much on the core design.

*** QST *** QST *** QST ***

Please excuse my interruption. I will try to make this brief.

As you can see from my signature, I am currently the Emergency Net Manager for ARES Oregon District 1. I am also very interested in "home brew" antennas that can be built for emergency as well as portable installations.

As we all know there has been a great influx of new hams in the last several years. Most of them have little or no experience in building equipment. Too bad it seems, the days of actively involved "ELMERS" have become history.

My goal is to publish (with your help of course), a booklet for the new (and not so new) hams on how to build inexpensive antennas without having to be EE's. The plans should be easily understood and would be most beneficial if they were as "Bomb Proof" as possible.

If you have such plans available, please drop me a note at any of the addresses listed below and I would be more than happy to send you a SASE for them.

Thanks for taking the time to read this. I will post follow up messages letting you all know how it is going and publicly thank any contributors.

I just got an IBM PC '86 and I was wondering if
any of it can be salvaged for radio.
if you know of any parts that can be used e-mail
me at drjackle@webspan.net
if you want any of it do the same, will work out
something.

I got the power suplys from the '86 and from a
tandy 1000.
I got the '86's motherboard, video card, and all
the interface cards.

YOUR COMPETITORS HAVE IN-HOUSE ACTIVE FILTER CAPABILITY. DO YOU?

Active filters are more important than ever before, particularly in high speed signal processing applications! Can you design to an arbitrary frequency response in any circuit realization of your choosing? The experts can! They rely on AFDPLUS...

Try increasing the value of some of the capacitors (eg between base and emitter, between emitter and base) slightly. If you have a coil in series with the crystal, you could make that a little smaller (though this will reduce the pulling range). I find coils for VXOs are critical. I use one of those two hole ferrite balun cores for TV use. With one of those I get about 18 kHz shift on 7 MHz with a VXO I built. Use of a ferrite toroid was less successful. You might be able to increase pulling range a little if you're willing to eexperiment.

>help...
>

A bandpass filter would help, but a simple series tuned circuit resonant on 3.58 MHz across the antenna should be OK. You could try a 10uH RF choke and capacitance around 200pF.

Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.homebrew,rec.radio.cb,rec.radio.swap

I have a brand new unused Bird 4522 Wattmeter/SWR indicator. The model 4522 is a rack mount model that has places for two Bird elements and a front panel switch so that you can switch between forward and reflected power measurements. The 4522 sells for over $400 list price from Bird or Bird dealers. I will sell for $275 plus UPS.

I also have a used Bird 4522 rack mount in very good condition that I will sell for $200 plus UPS.

: The curreent handling is limited by the temperature rise. You can connect
: the anticipated load for the anticipated amount of time. If the transformer
: becomes only warm, you are OK, if it becomes hot (and smelly) it wont do
: it. The voltage drop at full load depends very much on the core design.

I agree with Mortiz here... and offer the following as a way to be more quantitative: Measure the winding DC resistances accurately at room temperature. Connect a load (start with a moderate one, one you are pretty sure will be safe!) and let it run for long enough to reach thermal equilibrium. Disconnect the AC and load. Quickly remeasure the winding DC resistances (before it has a chance to cool significantly). The change will tell you to a close approximation the temperature rise, since the thermal coefficient of resistance of copper is about 0.39%/C. So if the resistance of any one winding increases by 15.6%, it indicates a 40C temp rise in the transformer...which should be OK, but I'd not want to see more than a 60C rise unless I knew for very sure that the insulation in my transformer was rated for it. (You can get a modest increase in safe transformer output volt-amps by blowing cool air over it or putting cooling fins on it.)

Also, be very aware that a resistive load is not nearly as severe as the load of a capacitor input filter; best check it operating into the rectifier/filter you plan to use, with your load a DC one on the filter output. The RMS current into a rectifier/capacitor input filter is typically much higher than the average current out of the DC supply, by a factor of 2 or 3. (Depends a lot on the capacitor and the "stiffness" of the transformer voltage.)

Cheers,
Tom

G'Day All,

I have been doing some reading regarding Receiver Splitting from one Receive antenna, but have so far been unable to find any information on how to construct one. I can purchase one, but I would like to try and build on first.

The reason for the Splitter is so it can be used at our repeater site, which has muiltipule repeaters.

If anyone can help could you please E-mail me or reply via the news group.

They're better for bypassing than ceramic disks. That size and value will
make excellent bypass capacitors for the HF range and well beyond.

Depending on the frequency, a TVRO dish could work well for you, the mesh is designed to work at frequencies of up to 4 Ghz. As for gain, at 432 mhz, a perfect 12 foot dish has a gain of about 22 dB over an isotropic radiator, according to charts in the ARRL Antenna Book. A 10 foot dish has a potential gain at 432 Mhz of about 20 dB, i figure by interpeting the charts. At higher freqencies, the potential gain is even higher.
At 1296 Mhz, that same 10 foot dish has a potential dBi of about 26 dB, and in fact people have used 10 foot dishes for EME work at these frequencies.
At lower frequencies than 432 Mhz, a dish becomes impractical. A 10 foot dish at 144 Mhz has a dBi of only 8 or 10 dB, a figure I can equal with a homemade 4 element Quad.

The ARRL antenna book also has ideas for building feedhorns for dishes, and other ideas. Good luck and 73

I've thinned down the newsgroup list a little -- hope you see this.

Basically, junker computers are nearly as good as junker
vacuum-tube TV sets for ham radio parts sources. You have to
be willing to dig.

I've heard of people successfully pulling ICs off of soldered
boards, but personally haven't had great luck. The capacitors
come off easily enough with a soldering iron and are well
worth taking. Any of the TTL or CMOS discrete logic chips
are worth taking if they'll come along easily -- I haven't found
the magic technique yet.

I've tried these methods --
o Heat the solder side of the PC board with a blow torch
(Chip packages seem to melt before the solder)
o Solder wick
o Desoldering gun/"snot-bottle"
I haven't tried making a desoldering tip the size of a DIP IC
for my 100-watt iron yet -- maybe that'll work. I've also seen
people in the electronics salvage industry use a bed of heated
sand, drop the board on the sand, and pick chips off with a
chip puller. Might work....

The memory probably isn't worth messing with, same with the
8086 and controller chips. If there's an 8087, it's worth
taking -- people will still pay a couple bucks for one of these.

Inside the power supply -- there is at least one hi-voltage,
hi-capacitance filter cap VERY suitable for use in an HV
power supply. You'll need four of these (at least) to series
a filter cap bank, but the voltage range is typically 250 to
400 volts and it's drilling apart a power supply. There's also
a nice fan -- and it always amazes me to see people spend
$3 for a fan but pass up a 25-cent XT power supply. The power
supply has the best stuff -- hi-watt resistors, some toroids,
the capacitors, and some potentially useful switching transistors
that should work on 80 meters.

Happy hacking.

Hi Chris

Follow some of the links from my web site you will find plenty of info on parabolics.

The problem with a big dish will be:

1> surface accuracy at required freq. No lumps can be bigger than 1/3 wavelength or you get squints

2> solid or mesh? If mesh the holes cant be bigger than 1/10 wavelength wide or you get losses

3> pointing accuracy required. A big dish might need a pointing accuracy of 3 degrees. Pretty hard!

I would go for a smaller dish, say 1M - perfect gain for higher bands, reasonable pointing accuracy and easy to control.

Polarisation, depends on what satellite, but normally circular - simple helix feed at the dish focus for 2.3/3.4 and a horn with phasing adapter for 5.7 and 10 ghz.

I think you must be gearing up for 3D.

Let me know more, I maybe able to help.

Hi all,

My homepage is getting bigger and will continue to do so until Telenordia tell me I have run out of disk space on the server. Since the last list I have almost finished my General Coverage receiver, and it works a treat. I have added a 10 (15) watt HF linear amplifier, complete with the PCB foil (uses the cheap CB type PA transistors).

I have even included a couple of pages about 'estimating' size of heatsinks. Visut my page at:

http://user.tninet.se/~acz732k/

Amongst my constructional projects are:

BASIC INFO FOR BEGINNERS
How to solder
Component identification
tools
How to calculate heatsinks

ANTENNAS
Remote tuning of tuneable antennas
Basic dipole information
Short antennas for the HF bands
A balcony/terrace antenna (worked JA on it)
Packing crate antenna
Frame antenna

RECEIVERS
General coverage HF receiver
Cigar box HF receiver - uses battery valves
IC HF receiver
HF direct conversion receiver
Regenerative HF receiver
HF and VHF receiver using ZN414 (ZN416)
Modifying domestic receivers for HF SSB
Modifying domestic receiver for 160 meters
Synthesized receiver

TRANSMITTERS
FM (88+108MHz) 'BUG' (can be modified for 30 MHz)
250mW HF bands CW TX
4 watt PS for the above

5 watt CW TX - dead easy to build
CW TX using voltage regulator
Single valve TX
Two valve TX
Cigar box transmitter (valve)
145MHz FM TX
QRP SSB TX
3 watt linear 1 - 30 MHz
Phasing method SSB exciter
500 watt linear amplifier
April 1st transmitter
10 watt linear amplifier (30dB gain)

USEFUL
VHF NBFM Crystal RX based on a coffee tin
250vDC for valves using modern components
Stereo enhancement for HF CW
CW filters
Self tuning CW filter
Q-multiplier
CW keyer using 'relay logic'

DATA/INFORMATION
QRP frequencies
Measuring micropowers
Making PCBs, several methods
G0TLAs QRP circuit database on packet
Coil winding and 'turns' calculation.

DOWNLOADING
Signal generator program
All my QRP@WW circuits in a ZIP file
PCB foil for BUG TX (later version)
'Adult' screen saver

BREWING BOOZE
Brewing beer, wine and 'mash'
Distilling the mash (3 methods)
Making liquours

---------- and more ----------

I will be adding more to the homepage constantly, as long as
I have the time available to do it.

Have fun with QRP (and QRO) de Harry, SM0VPO, Upplands V&#65533;sby.

Hello,

I have a Marage 10 in 150 out 2m amp. "g150"?
Has fm/ssb switch.

Want to trade for a 6m sb200 or another 6m amp...
I'll take a sb-200 that needs to be modified.

Let me know what you got.
Thanks.

>under 20 feet long and build on a sturdy aluminum boom, with 17-21 dB of
>average forward gain, giving you an effective radiated power of about
>200 forward Watts RMS for every 10 Watts RMS of input to the antenna?

Well, if the antenna were professionally designed, you would certainly care
to specify the gain a little closer. If it were anywhere near the quoted
figure, many EME-ers would immedially throw away their arrays.

In fact, there is no reason to believe that the gain exceeds that of a
typical 20 ft yagi, at about 13 dBd, the plans for which are *free*.

73, Moritz DL5UH

## 1182. Re: A survey question for you

I was wondering when someone would put up a log quad!
Our club built a 5 element that is great!

I wonder why the 'weak signal' guys dont use them more often?

Hi Al

Wouldn't have thought they would have made much difference at that freq!
As long as the leads as kept short and they fit your planned PCb holes I
don't see a problem

It is almost DC anyway :)))

Hi mate,

Re removing ICs. Some years back myself and a bunch of other folks in a ham club were given a pile of Burroughs PC boards loaded with a now defucnt CTL logic family (an early current mode logic). In an effort to recover the stuff (1970) we tried many trick and finally the late K6OIK, Len, came up with a scheme which I modified slightly. The trick is to find an old American Beauty soldering iron that takes a copper slug type tip (approximately 3/8 inch diameter) and then fashion new tips from 3/8 inch od copper tubing. Then you can hammer out a nice sharp flat end the width of the chip you want to remove. No attempt was made to save the multi-layer pcb, but by applying the heat with a sharp edged and tinned heating tip that hit all pins on one side, we were able to pop the chips off one side at a time with a little prying action. We rarely lost a chip, but did pull a lot of thru-holes with the chips (no big deal).
The process was not pretty nor delicate, but when TTL was selling for a couple bucks a piece for JK flops, it sure got a lot of projects off the ground. The tip required continuous trimming and filing and hammering, but it was a cheap tool and easy to make new ones. The key was keeping the tip/blade sharp and square cut.

A while back Bob Pease dicussed (in his Pease Porridge column in EDN) tricks used for making temperature-stable chambers. He claimed that surounding the chamber to be stabilized with a second chamber of some sort was very effective. In his lab, he's used cardboard boxes nested inside larger cardboard boxes to make thermally stable test chambers, and says he keeps old boxes around just for this purpose. If you have room for an outer chamber, seems like a cheap and simple thing to try.

Cheers,

Jon

Dear Jonathan,

I suggest that when an antenna has a forward gain of X db, the Effective Radiated Power (ERP) should be X db higher than a reference antenna. You are suggesting a 20:1 factor (13 db) for Effective Radiated Power, but the Forward Gain you mention (17 -20 db) is not consistent with that ERP. Have I misunderstood something?

>be sealed and locked, or glued tight.

Hi!

Done a few. You CAN prise them open, you just need to take your time!
Use a sharp knife along the seams, then gently prise them apart. Be
careful, all the insides will fall out!

Once you have replaced the cells you can gently pack it all back in and
then glue the case shut. I have used a number of glues, but epoxy resin,
marketed in this country under the name 'Araldite'. Use a thin layer on
all the seams and use tape to hold it all together whilst the glue
cures. I have heard of people using instant 'superglues' but I don't
know how effective these are on the plastic used?

Good luck!

73 Simon

## 1204. Ideas for a 6M RC system

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-19 00:00:00 UTC
From: Andy <andy@microcosm.net>
Message-ID: <5qqmqp$otg@paperboy.world-net.net>
Source record: 92455

Anyone have any ideas for a 6M remote control xmtr and rcvr (located seperately)? I designed the simple electronics, I just need to link the modules. It's only a (psuedo) 2 channel system. I didn't want to do pulse modulation, so the transmitter sends 4 tones and the receiver decodes them. Basically either forward or reverse for each servo.

Should I use FM or AM? I know that AM would be much easier to build, but FM would be clearer. Any suggestions for design and or mode?

>ERP. Have I misunderstood something?
>73
>Bob

No, I just mistyped it. Also, my figures for forward gain in dB is an
aproximate extrapolation from the specs for a 2 element quad, which has
about the same gain as a 3 element yagi.

You have to realize that raw data on quad antennas is relaticely
non-existant for quads over 4 elements. Nobody else to my knowledge has
ever recorded any such data for a common quad over 4 elements, much less
for one that is log-spaced and has an aluminum boom. I believe mine is
unique in it's particular design and combination of materials.

What I can tell you for sure is that with 6 watts output from the rig, I
was able to register a solid reading of 10 dB over S9 in San Diego from

Inglewood, CA which is about 120 Miles from me. My quad is about 40' above the ground. My Ringo Ranger is 50' above the ground and is not at all heard by the same station in San Diego with his squelch open, nor does it even move his S-meter. Perhaps that will give people a more tangible idea of the gain. Of course, results do depend upon terrain too. There are some hindering conditions I must overcome for that contact including a range of palisades and a small mountain range. That's why they call this the Los Angels basin, because we're surrounded by crests on all sides, except for a fraction of our shoreline, but even half of our shoreline also has very high ridges seperating the city from the beach.

Yes 13 dB would be right for a yagi the same size, but this is a quad and quads generally have about 1/3 ro 1/2 more gain than a yagi when the quad's elements are the traditional even-spacing. using log-spacing opimizes the gain. I guestimate my forward gain is likey 18 dB, but I thought I'd better give a margin for error which is why I stated the above range in my first post.

I don't know which newsgroup you read this in but after this I won't be posting to *.misc after this because it generated an annoying automatic message which I did not want or solicit. I hope it doesn't put me on any mailing list or I'll be having a fit with a certain someone's ISP admin. But if it didn't then I'll just ignore it and drop the newsgroup.

Greetings from 1stfamily,

As we all know unlimited Internet access is $19.95 / month
with every major Internet access company. From Netcom to
AT&T that price never changed. So what makes us any
different when we are also charging $19.95 / month ???

Our Marketing Plan.

Our method is this. Unlimited Internet access for $19.95 per
month. If you find our service to be extremely satisfactory,
in which we are sure you will, you can refer our service
to 10 of your friends and family. If you do , you will get
free Unlimited Internet access with your e-mail address
for life !

What we offer is this:

* The fastest, clearest Internet access in the world.

* World Wide Internet access in over 110 countries.

* An e-mail account that is also life time free if you refer
10 of your friends and family to using our service.

* America On-line for only $10 / month !

* Much much more that will amaze you !

Our plan is by the year 2005 we will be the world's ONLY
Internet service providers. With our technique of offering you
life time free Internet access we will be.

Please visit our web site http://www.freeisp.com/ any where
from the world to know more about our opportunity and to even
get on the wagon before every one else beats you there.

http://www.freeisp.com/

Please forward this message to all of your online friends. Wouldn't you
want all of them to get free internet access ?

---
Abdul ( SPONSOR ID # SAF5197 )
Stop paying for Internet access !

> same price that contains a wealth of other info as well?

Because "that kind of information" can not be obtained from any of the above about THIS antenna design. Pay better attention before passing judgement.

There is no published info on QUAD antennas over 4 elements. I know because I searched both the net, ham retailers AND a bunch of well stocked ham sections at libraries.

This is is not some yagi found in any VHF antenna book. This is MY OWN ORIGINAL design.

> Jonathon, that was a nice try, but the internet was originated as
> a medium of exchanging information, not as another commercial
> medium. Maybe another product (porn seems to well on the 'net) or
> another medium? Some adds in the ham magazines carry ads for
> products at outrageous prices and they reappear month after month
> so they must be making some money.

You were already sounding like some snobbish ninny with his head stuck up his rectum when you made the false judgement about me in the forer paragraph. But your latter paragraph is what really enforced it.

I'd bet you also belong to an all-white country club,(that intends to remain all-white), and/or are a member of a Satanic... oops... I mean Masonic Lodge,(Satanic/Masonic...same difference), and were in some snobbish, exclusive fraternity in some ivy-league university, which one could only join if you raised to believe that your so good your dung doesn't stink. You sound like JUST that type! One of the rich white democrat "Omega House" elite types like the "Greg" character in the movie "Animal House".

GIVE ME A BREAK! I've got news for you, I might not be rich, white, high-class, drive a status symbol or look down my nose at anyone who isn't stamped from the same cookie-cutter, but that doesn't make me dishonest pal and it doesn't make you any better than me. Why don't you get off your high horse, go find a good baptist church and let them teach you something about HUMANITY and about being a member of it!

Don't bother sending me any more email again until you come down to
Earth, Mr. Demigod. Because if there's one thing I can't stand, it's a
prejudgemental liberal snob!

In other words... go blow it out your ear!

Sincerely,

Jonathan DeFabritis

It's not "M8506", it's "MB506", by Fujitsu. I designed that
IC into the HP 5334B frequency counter C channel. You could
order one as a replacement part from your HP service center.
The HP part number is 1820-5276.

# 1230. Needing info Mixer, Filter

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-21 00:00:00 UTC
From: tonyz@rose.hp.com
Message-ID: <5r0jpi$srl$1@rosenews.rose.hp.com>
Source record: 92312

Hi there!

I ordered an NE602AN mixer from Dan's Small Parts.

Danny didn't have an NE602 so he sent me an NE612.

Does anyone have info on the 612 that they can share?

Dan says they are the same thing, but I dont know, I
dont have the specs or pinouts to compare.

Also, I bought some 455kc ceramic resonators but
haven't found any circuits that use them. The appear
to have only 2 leads coming out and I am only familiar
with ceramic/crystal filters. Would I use them like
crystals in a filter arrangement?

Thanks radiomen!

tony

I reccommend looking for the book "30 Simple Radio Receivers" or something
like that (Sorry, not in front of me) on www.amazon.com or a bookstore.
It has numerous receivers, all different levels of difficulty.

# 1232. F.S. Plate Xformer

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-21 00:00:00 UTC
From: Greg Bailey <gbailey@mail.sdsu.edu>
Message-ID: <33D43624.67A4@mail.sdsu.edu>
Source record: 92314

For Sale:

UTC Plate transformer. Model/Type S-49

Single primary @ 120 VAC 60 Hz.

Single (center tapped) secondary, with the following voltage taps:
4,200 V, 3,200 V, and 3,000 V. Secondary rated at 0.3 Amps.

The "pig" measures approximately 7.25 inches square and 6" high. It
mounts with the terminals vertically downward (through the chassie).

Condition appears to be new. The primary terminals have been soldered
to, but the secondary are still virgin. Electrically high potted at 5
KV.

Hang a pair of 866's to this device and bask in the blue of yesterday,
or, couple it to a bridge of diodes and bypass yesterday.

Price, IF you will pick it up in person the cost is $50. If I got to
ship it to you the cost will be $50 for the xformer, $50 for me to build
a wooden box, plus greyhound or UPS costs.

Oh did I tell you this thing tips my bathroom scales at about 30 lbs. I
didn't really weigh it, because my bathroom scales are upstairs and the
xformer is in the garage. In other words it would require me to carry
it up.....

If you are planning a KW, this is the potmetal that will hold the rig to
the floor.

First come first served. If you are not happy with this rock crusher I
will refund your cash. Count on it.

Greg

These are Mastr progress and not plain Progress line rigs
right? Mastr pro uses solid state rx and hybrid tx with 3 tubes.
the power supply for these and terminal strip are the same for all
bands. I not sure about the all Progress line wich is all tubes.

## 1242. UPS parts for GEL cell charger?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-21 00:00:00 UTC
From: wmeara@erols.com
Message-ID: <33d32e52.75495840@news.erols.com>
Source record: 92395

Homebrewers: I have a bunch of old (and possibly serviceable) GEL cell batteries. I'm hoping to press them into QRP service. I was thinking about how to charge them, when I remembered that I have an unused computer UPS laying around.

Has anyone used the charger circuitry in one of these beasts for the charging ham application Gell Cells? How about disconnecting the inverter circuitry and turning the UPS into a 12 volt supply/Gell Cell charger?

Any suggestions on how to determine which of my batteries are save-able?

Thanks, 73 Bill N2CQR

Hi gang:

Great news! We have two new Web Sites for you to check out. The first, The KB8TNQ Ultimate Amateur Radio Page! is a great source for all kinds of information on the Amateur Radio hobby. It's been up since 11 May, 1997 and is generating some great feedback.

The other, The Central Michigan Amateur Radio Club Web Site is mainly about our club and it's activities, but we have added a FREE "Trader's Page". If you have some ham gear or computer items to sell, this is the place to be. With posts all over the internet, this site will soon be our most popular, so come on in and give us a look!

7-3,
Jim (KB8TNQ)

Are there any good introductory books about how radio receivers work
and how to build them?

I like to listen to shortwave, but find that most of the 'affordable'
receivers come with a cheap antenna. I've gotten to the point where
I'd rather build my own (receiver and antenna). It's been a long time
since I've touched a soldering iron (senior year of high school -
1979), but I'm game to re-learn what I've forgot since high school..

Any suggestions for the eager beginner?

I also have in my possesion about 25 feet (maybe more) of
10 Base 2 Ethernet cable. It is shielded RG-58 Type 20 AWG cable.
Should I try to strip the shielding and use the wire to build an
antenna?

Thanks for the help....

Can you provide the details of this "extrapolation"? Differences
in gain between short yagis and short quads disappear quickly as
the boom length approaches multiple wavelengths.

> You have to realize that raw data on quad antennas is relaticely
> non-existant for quads over 4 elements. Nobody else to my knowledge
> has ever recorded any such data for a common quad over 4 elements, much
> less for one that is log-spaced and has an aluminum boom. I believe mine is

Huh? Any decent modeling program based upon any of the NEC models
can tell you what the gain will be. Having done extensive modeling
of yagis, quagis, and quads at VHF/UHF, I can tell you that there
is little in appreciable gain to be had in quads over yagis when you
hit 3+ wavelengths.

> What I can tell you for sure is that with 6 watts output from the rig,

> shoreline, but even half of our shoreline also has very high ridges
> seperating the city from the beach.

Anecdotal evidence is just that. I've worked Oklahoma from Illinois
on 6 meters loading up my 2 meter ringo ranger. That certainly
isn't an endorsement for a 2 meter ringo on 6.

> Yes 13 dB would be right for a yagi the same size, but this is a quad
> and quads generally have about 1/3 ro 1/2 more gain than a yagi when
> the quad's elements are the traditional even-spacing.

This is only true for very short quads. At multiple wavelengths, the
differences are negligible.

> using log-spacing
> opimizes the gain. I guestimate my forward gain is likey 18 dB, but I
> thought I'd better give a margin for error which is why I stated the
> above range in my first post.

Guestimate? Have you modeled your antenna with any reasonable
modeling program? The NEC based programs are fairly accurate and
would likely show you that any such differences in a quad versus
yagi are negligible.

> I don't know which newsgroup you read this in but after this I won't
> be posting to *.misc after this because it generated an annoying
> automatic message which I did not want or solicit. I hope it doesn't put me on

> But if it didn't then I'll just ignore it and drop the newsgroup.

The appropriate newsgroup would either be rec.radio.swap (if you are
indeed "selling" these "plans"), or rec.radio.amateur.antenna if you
are posting the designs.

73,
Todd
N9MWB

PS I love quads and feel they are great antennas for beginners and
for simple construction projects. I'm also a realist and don't
want to see others mislead by inappropriate "guestimates".

PPS Do you think you could make your signature file longer? :-(

This does't work, but here's what Seth will send you for $5.
Please circulate these plans throughout the world whenver you see
the "cable box descrambler" ad.

And if you get the "new improved" plans (some of which do still work)
please post those too.

///PAY TV DECODER PLANS///

MATERIALS REQUIRED:

1 - Radio Shack mini-box ( #270-235)
1 - 1/4 watt resistor, 2.2k-2.4k ohm
(RS #271-1325)
1 - 75pf-100pf variable capacitor
(Hard to find)
2 - F61a chassis-type coaxial
connectors (RS #278-212)
12" - No. 12 solid copper wire
12" - RG59 coaxial cable

///INSTRUCTIONS///

1. Bare a length of No. 12 gauge solid
copper wire and twist around a 3/8"
nail or rod to form a coil of 9 turns.
Elongate coil to a length of 1 1/2"
inches and form right angle bends on
each end.

2. Solder the variable capacitor to the coil. It doesn't matter where you solder it, it still does the same job. The best place for it is in the center with the adjustment screw facing upward.

Note: When it comes time to place coil in box, the coil must be insulated from grounding. This can be done by crazy-glueing a piece of rubber to the bottom of the box, and securing the coil to it.

3. Tap coil at points 2 1/2 turns from ends of coil and solder to coaxial chassis connectors, bringing tap leads through holes in chassis box. Use as little wire as possible.

4. Solder resistor to center of coil and ground other end of resistor to chassis box, using solder lug and small screw.

5. Drill a 1/2" diameter hold in mini-box cover to permit adjustment of the variable capacitor from the outside. Inspect the device for defects in workmanship and place cover on mini-box. Tighten securely.

6. Place device in line with existing cable on either side of the converter box and connect to television set with the short piece of RG59 coaxial cable. Set television set to HBO channel.

7. Using a plastic screwdriver (non-metallic) adjust the varible capacitor until picture tunes in. Sit back, relax, and enjoy!!!

## 1252. Help with noisy fuel pump!!!

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-21 00:00:00 UTC
From: jimp911@aol.com
Message-ID: <19970721194401.PAA23932@ladder02.news.aol.com>

Need suggestions on ways to suppress EMI from the fuel pump in my Toyota truck.

The pump is submerged in the tank and is fed with unshielded wiring. I tried several snap-on ferrite chokes, but it made little difference.

The hash this pump emits is s-9+ on HF, and the noise blanker in my TS-50 has little effect.

Thanks & 73

Jim W1UK

# 1253. WANTED! Simpson 260 Schematic/Parts List

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-21 00:00:00 UTC

Hi All;
I have a Brand new, never opened 80 and 40 metter CW transmitter in KIT form.
Made by an electronics firm here on Long Island, I suspect in the 60's.
The kit also requires you to punch or drill the chassis and front panel with a paper templete(supplied), wind the plug in coil on a supplied form, etc. This is a complete TUBE XMITTER in KIT FORM.
Price is $125- shipped CONUS.
Thanks es 73.....RICH RLUCCH2098@aol.com

# 1257. 900 MHz Cordless exciter?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-22 00:00:00 UTC
From: don.phelps@infoway.com
Message-ID: <869539490@infoway.com>
Source record: 92321

I am looking for more details on operating in the 902-928MHz amateur
band (I'm Advanced Class) with a Uniden 900MHz EXP95 Cordless telephone
that operates FM. Base transmit 926-27.95 MHz, Handset 902.05-904
Base rated 9V, handset labeded 4V Sealed Lead-Acid 500 mAH.

I am curious about adapting an external battery back to the handset,
and running the base from another battery source.
(Such as 13.8 volt lead-acid.)
I assume I can build my own charger for the Handset battery by just
calculating for a 2 cell gel-cell of 500mAH rating.

My questions:

1. What is maximum voltage for base, handset?

2. Is there a design for a pre-amp/amplifier to use with such units?
3. Do I have any restriction living in SF Bay Area other than
normal 1500 watt/lowest power to achieve communication guidlines?

4. Is there a class E amplifier schematic available for this app?

5. I presume I can use directive arrays to match my expected
location during my extended excursion.

6. Does anyone offer such a device commercially?

Thanks for help.

I purchased a kit of capacitors for my 761 from Icom. I believe the cost was about $12.00. Replacement was not easy! I had to remove the metal shield soldered to the main PC board. It corrected my VCO lock problems though.

I believe the problem with the original plastic trimmers is corrosion. You might get some extended life out of them by rotating them several times and then realigning them. Eventually they'll probably have to be replaced however.

Info about S-AV17?????

>From a Ham-friend, i got a powermodule.
>It is a powermodule from TOSHIBA, the S-AV17.
>I know he's working around the 2 Meter band.
>Can anyone help me with some info or a datasheet of this module??
>I want to find out, which pin is for what.
>Please send me a email, when you have some info.

Hi Marco:

The S-AV17 should be an easy unit to use. Input RF of 400 milliwatts
for 50 watts output. Class C operation. Freq. range 144 to 148 mHz.

```
,------------------------,
||||| TOSHIBA |||||
)|| S - A V 1 7 ||(
||||| |||||
'-1--2------------3-----4-'
| | | |
```

Pin #1 RF input 50 Ohms
Pin #2 Power level control
Pin #3 13.8 Volts DC supply
Pin #4 RF Output 50 Ohms
The metal tabs provide the electrical ground as well as heat sink
mounting.

I need the data sheet myself and I am going to explore the Toshiba
web site today. If I find more info and applications, I will let you
know what I find.

# 1268. Help Identify Transistors

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-22 00:00:00 UTC
From: Curtis Scholl <cscholl1@ford.com>
Message-ID: <33D517F9.37AE@ford.com>
Source record: 92332

Hello the Group!!

About 10 years ago I purchased a bunch of "poly paks" of
transistors. The only identifying mark is

SYL 101 or SYL 1101 or SYL 1001 and I have had a terrible time
identifying what they are as NPN PNP FET etc.. I made a guess and
thought they might have been Sylvania but they don't know either.

They are metal canned and looking down from the top they are 3/32"
deep and nearly 1/2" wide with rounded ends and looking at them standing
on the leads they are square. The leads are tree with two set close
together and separated by distance from the third.

I have seen this case before but do not know the TO-??? id.

Any help appreciated

Curtis Scholl
cscholl@juno.com

# 1269. Re: SIX METER AMPLIFIERS BUILT

Gerald Schmitt wrote:

> Can you say, "Amateurs may build one amplifier per year in this band
> without type acceptance for their personal use."?

Sure can. But the listing really didn't look like an
"I built an amp" post, it looked more like a "I built ten of these
and can build 50 more by next week" post. The offer for sale
of 6-meter wattmeters reinforces this.

The fact that world-famous CB DXer philip de cadenet <phil@two-
way.demon.co.uk> put in his two pence worth suggests that these
amps may have applications on bands other than 6 meters.

Still, I'd like to see a working 811A 6-meter amp. I'll email
the original poster. Sometimes you guys take yourselves way
too seriously.

I have built the 6 meter FM Transceiver, and had excelent results. The
manual was very well put together with explanations and very useful
information. The alignment is simple, and the equipment needed would be
found in just about every shack, no matter how small. Before buying this
kit, I looked at other kits available, and found that for the money the
Ten Tec has more features and is more complete(ie Case, mic, etc.)than
most of the other kits I looked at. Also with one little mistake that I
made in parts identification, Ten Tec help with finding the problem and
then rushed the part to me.
With this, I would not hesitate to construct any of the Ten Tec Kits or
buy any of there equipment.
I am telling you this as I feel that as hams, if we find a product or
kit that lives up to the ads, we need to let others know.

73's hope this is what you were looking for

# 1274. pointer on mod uniden bc210xlt for wxsat reception

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-22 00:00:00 UTC
From: rmf@ultra01.santafe.edu
Message-ID: <ydwwmiwu5s.fsf@ultra01.santafe.edu>
Source record: 92338

Hi,

I read the latest QST on wxsat reception. I thought it would
be fun (and cheap) to modify an old uniden bc210xlt scanner to have a
large enough passband to permit wxsat reception. I have read that some
scanners you can bypass the existing passband filter and provide your
own with a capacitor. Can this be done to the bc201xlt.

I don't have a schematic for this scanner. However, I was
hoping someone on the net could provide me with some pointers and or
advice.

thanks,
Rob Farber

> Cliff K7RR

Oregon District 1 ARES is roughly the NW corner of Oregon. It is comprised of Clackamas, Clatsop, Columbia, Multnomah,
Tillamook, Washington and Yamhill counties. During the flood of 1996, all 7 of my counties as well as 13 other provider
services were activated. Made for a long weekend. 6 days 18 hour averages.

I am trying to compile a booklet to be made available to any "new to the hobby" or "new to antenna building" hams. I
have "elmer'd" more than a few hams who got their license, bought an HT and thought that was all there was to the hobby.
The first time I helped them build something and then they saw it work, it opened up a new whole arena for the hobby. I
am just trying to make that type of information available to others. So many times, I have purchased a "How To" guide
to antenna building only to be overwhelmed by all the techno-babble. I have built many antennas from one-page
photocopied instructions with great success.

"Build a field and they will come!" I just want to make easy plans available. If the person wants to go on and learn
more about why it works, then great. At least something was available to pique their interest in the first place.

# 1282. Doppler indicator & LCD for MicroMint Controller

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-23 00:00:00 UTC
From: "Lawrence R. Brandt" <Lawrence_R_Brandt@ssb.com>
Message-ID: <33D64820.A7374616@ssb.com>
Source record: 92345
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.digital.misc,rec.radio.amateur.misc
Body handling: HTML body converted to readable text

Hi All,

I have 2 questions. First is does anyone have a circuit to attach to a Roanoke

Doppler design and add digital bearing info? I could just fudge the 4 bit output

to read multiples of 22.5 degrees, but that does not add any accuracy.

Basically what I want is a circuit that can judge the time between when

a trailing pulse is detected and another event (oneshot firing) occurs. Then

take this number and display it as a 0-360 degree display. But I realize to

do this I will need to know when the period is over, when the 360 mark has been

reached. As I sit here thinking about this, I may have an answer but need some

help making it work!

I will need a clock that can count from 0 to 359 in a certain period

defined by a "start counting" trigger and a "latch & display" trigger.

In the doppler, this could be the zero crossing point of the tone (as start)

and the firing of the oneshot to enable the display. I'd need to include a

calibration pot to vary the clock period, so that there are 360 clocks between

zero crossings. If the doppler clock were a multiple of 360 and not 22.5, this

would be easier! ( & with appropriate output and/or display logic)

But has anyone seen such a circut for a Roanoke doppler? There is a company

around that sells a unit with a display like this, but how does it work?

(I'd like the output to use an LCD display, if possible)

Second question:

If I have the above bearing as a number between 0 and 359, and my GPS

is outputting RS232 data for my current position & heading, is there a simple

circuit to:

Decode the RS232 current bearing info (16550/8250 UART, I assume),

Aquire the doppler's relative bearing info (serial or parallel),

Display a resutant bearing that is relative to true north (which the GPS is).

I have an original MicroMint BASIC-52 controller card with serial, parallel &

terminal outputs, so a program to do this would be easy to do, but could a dedicated

chip or small circuit do the same thing?

BTW, does anyone have info for interfacing a LCD display (small one, 2X16 for example)

to these Micromint controllers? I've seen a few aritcles but not the one I'm looking for.

I'd use this controller as a DF caluclator to get the true bearing, have a switch to "read" this bearing and save it to use in triangulation calulations, perhaps weighted by a "quality" measurement for the bearing. I'm working on the program for the triangulation and target

location but I'll need a small display (RS has one but I'd need details!)

Thanks for hanging in there!

Thanks & 73s,

Larry "Hello officer, its a qubical quad for direction finding, is there a problem?!" Brandt

I can suggest a couple of obvious candidates for
this booklet:

Copper Cactus
Twinlead J-pole

Plans for both these antennas have appeared in one or more of
the newsgroups this thread is posted to, and are readily available
in DejaNews or on AltaVista. In addition, the Copper Cactus
is available on at least one web site, and probably is listed
in some of the big search engines.

I hope that in the best of ham radio and internet tradition, this
booklet is made available for copying costs.

Hello everyone,

I finally found some amateur radio related news groups thanks to a
friend of mine. Id like to call your attention to the latest and (I hope
soon one of) the greatest amateur radio websites on the net.

My site is still under cunstruction but the primary structure and basic
links are there. More links and content will be added every couple days
as my time allows and I locate more links.

This site is at http:/www.qsl.net/kc8aco and a big thanks to Al, K3TKJ
at http://www.qsl.net/ for providing space for my pages.

73's to all and happy browsing.

> Thanks, 73 Bill N2CQR

We've been using a 12v 1000w inverter at our deer camp for both
a battery charger and as an inverter. Gel cells aren't fully charged
until they reach about .4v higher than wet cell (lead acid) batteries.
I wouldn't worry about it, but you could adjust the output voltage with
a resistor change at the charge controller IC. The max charge rate on
gell cells is about 10% of their amp hour rating. Your UPS will
exceed that. Our 1000w inverter seems to charge marine batteries at
about a 50amp rate. You will need a current limiting circuit.

I use a Radio Shack 350ma universal charger at 6 or 12v to
charge my gel cells. I put jumpers on whichever plug is convenient
(check polarity). You should be careful not to leave them on there
too long, since there is no taper charge control. Note that 350ma is
less than 10% of the 4ah 6 or 12v batteries I normally use, and
overnight is the longest time I leave them on there.

About the only way to
see if the gel cells are good is to charge them and then see how long
they run, and how long they'll hold the charge. I'd certainly keep the
inverter portion. It will use some power, but it could be real handy
for 120v in case of emergency, even if you had to run it off of your
car battery. Let me know what you want for the UPS if you're inclined to
sell it.

# 1292. Re: Radio Receiver Building for Dummies

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-23 00:00:00 UTC
From: Greg Bailey <gbailey@mail.sdsu.edu>
Message-ID: <33D6EDB9.2AB4@mail.sdsu.edu>
Source record: 92355

No hard feelings... but I think I would do some more scrounging on the used SW Receiver market.

Building a SW receiver is an underaking that only the tested solder throwing engineer/types would try. Let me point out some of the negatives:

1. Calibration of frequency (knowing what frequency you are listening to) is going to be almost impossible. Improper selection of capacitors in the VFO will cause it to drift, and so on.

2. Backlash, dial indication, etc.

3. Oscillation in the IF, bandwidth of the RF section/s, etc.

4. BFO?

And so on... God there are a million others. I would say to build a receiver is about ten times more a pain than a transmitter. A Transmitter can use a crystal to stay on frequency. Once you modulate it and rid yourself of paracitics (SP) you have it made. But a receiver... wrongo.

So what is the alternative: Start scrounging for used (tube type) SW receivers. Hammerland made millions of HQ-110, and HQ-100. Globe, Heath, and others made good receivers. I would avoid a Heath only because it is homebrew and thus home screwed-up.

Receivers surface all the tiime. List on this net: WTB SW REC for beginner. Many guys have an old box of tubes (receiver) in their basement. If they thought they could stimulate a person into hamdom using their old receiver they will probably give you the thing.

I would rather scrounge than build (a receiver). I learned the code, got a license, and enjoyed a number of years using an ARC-5 WWII aircraft receiver. Now they are probably $$$ as collector items, but others are not. Scrounge. And write me back when you either buy or build. I would like to hear what happened.

Greg

# 1293. DDC Video Amplifier - query

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-23 00:00:00 UTC
From: Peter Parker <parkerp@pcug.org.au>
Message-ID: <33d680a3.0@cheese.pcug.org.au>
Source record: 92356

I have a component called a DDC Video amplifier on an old circuit board I obtained. It is a VA23 type. I'm wondering if any reader knows much about them - ie input and output impedences, amplification ratio, max power output, max frequency of operation, whether they are linear and if they can be used in homebrew transmitters.

Any responses would be appreciated.

## 1295. ceramic resonators?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-23 00:00:00 UTC
From: tonyz@rose.hp.com
Message-ID: <5r5qe7$m0v$1@rosenews.rose.hp.com>
Source record: 92358

I'm still looking for any information on
ceramic resonators. Anyone have any
experience with them?

How are they used? Mine are 455kc
with 2 leads coming out.

Normal ceramic filters usually have 3 leads
so I am at a loss. I understand they are
basically piezoelectric ceramic elements,
but how does one use them in a small broadcast
radio project's IF section?

Thanks in advance

tony

Well, you can probably do it with 1 diode, 1 NPN Transistor like 2N2222,2N3904...,1 .01uF cap, 1 resistor (maybe somewhere around 1-10k).

Put one end of the resisor on the RF in from the amp. Put the other end of the resistor on the anode side of the diode. The cathode side of the diode goes on the Base of the NPN transistor. Then a .01uF capacitor goes on the Base of the transistor and ground. Put the emitter of the transistor on ground. Then, with a relay, put one end of the relays coil on +V and the other end on the collector of the transistor.

So, a little of the RF coming into the amp is rectified and filtered (diode and capacitor), and puts a little bit of DC bias on the base of the transistor to turn it on. You might have to experiment with the resistor value.

Is this for SSB operation? If it is then you will probably need some kind of delay before the amp kicks off. Maybe a high value capacitor across the relay coil would work to keep the relay on after the transistor shuts off breifly (SSB).

Guinney Pigg (yeahright@biteme.com) wrote:
: Are there any good introductory books about how radio receivers work
: and how to build them?

: I like to listen to shortwave, but find that most of the 'affordable'
: receivers come with a cheap antenna. I've gotten to the point where
: I'd rather build my own (receiver and antenna). It's been a long time
: since I've touched a soldering iron (senior year of high school -
: 1979), but I'm game to re-learn what I've forgot since high school..

You might be happier modifying, for your early efforts.

For instance, I started buying cheap SW portables at garage sales, figuring oout what made them bad, and rebuilding them. Some of them had real good circuitry but were lousy mechanically, some were total junk.

So you start by replacing sections. First find the detector and build a BFO to inject there. Later build a more stable VFO. Later still, add a good IF filter.

In time, you might find nothing left of the original radio (if you build it in modules). However the junk radio gave you a platform to test each circuit in turn.

Another approach is to start at the audio end and work towards the front end. This won't perform for you till you're nearly finished, but the circuits go from easy to harder as you progress in that direction.

Look into the integrated circuits that exist these days. There are chips that do just about anything. You can build an AM reciever with one chip and an audio amplifier, if you want to go minimal.

As for antennas, unless you are transmitting, concern yourself just with getting copper in the sky. This gets to be a diminishing return, beyond a certain point is no improvement, but too short is a killer. When you get beyond a random length wire, you begin to restrict what it can do.

For instance, cutting the wire to a particular length for a particular band improves that band at the expense of others. Designing an antenna with "gain" in one direction means it will have loss in another.

You could just not worry about it. Not yet.

Get the Radio Amateur's Handbook. Even an older one. Read the early chapters, and the early parts of later chapters. Don't worry about not understanding all of it.

: I also have in my possesion about 25 feet (maybe more) of
: 10 Base 2 Ethernet cable. It is shielded RG-58 Type 20 AWG cable.
: Should I try to strip the shielding and use the wire to build an
: antenna?

Heck no, that'd be a waste of cable. For SWL, a longwire works as well.

BTW, does it actually say RG-58? Many ethernet cables are 92 ohms. Even so, keep it for later. Makes real good audio cable, too.

## 1302. HTX-212 info

>of 6-meter wattmeters reinforces this.
>
>The fact that world-famous CB DXer philip de cadenet <phil@two-
>way.demon.co.uk> put in his two pence worth suggests that these
>amps may have applications on bands other than 6 meters.
Jim, it was yourself that mentioned this possibility, I only commented
on your post. Please re-read your post.
>Still, I'd like to see a working 811A 6-meter amp. I'll email
>the original poster. Sometimes you guys take yourselves way
>too seriously.
Hi Jim,
I agree with what you say about that amp supplier but not about the
world famous bit, maybe if you'd gone back 20 years!
Met a chap a few weeks ago thats been sitting behind his illegal (sic)
TS50 on 11m for the past couple of years and has clocked up a confirmed
244 countries. Nothing special I hear you say, but never the less ok for
18' of ali on the worlds noisiest band. I think I helped to convince him
it was time to consider taking his ticket to enjoy the hobby even more
and reduce his chances of being busted big time and loosing his radio
equipment.
I definately agree with you in that most licenced op's take the hobby
far too seriously.

Phil G4ZOW/Xtreme mobile 8 X 2SC2879 homebrew.

PS. Jim, I have a Siemens 10kw broadcast tx for sale c/w Telefunken
exciter, all solid state except final, tunes in 100hz steps from 1.5 -
29.999Mhz and all modes including SSB. And yes, it's 3-phase and heavy.
Complete with all manuals and in perfect working order.
If your interested that is.

> (snip)

It's easier than that. Use a small torch, or one of those
high-temperature heat guns. Works for SMD too - like reflow
soldering in reverse. Just be careful... :-)

My favourite technique for removing chip resistors and capacitors
is to use two soldering irons with little tips. Heat each end of the
component, and then use the two irons as tongs to lift it off. Easy!

I don't have anything handy, but an easy way is to use an op-amp connected as a comparator monitoring the D.C. voltage change across the primary of the output audio transformer. There will normally be no voltage drop from the cutoff output transistor (squelch closed) to a couple hundred millivolts with the squelch open and the output transistor conducting. You may have to experiment a bit, depending how you reference the comparator inputs and power. Of course, this assumes the AF output uses a transformer match to the speaker.

I agree with Greg. I am an engineer with quite a bit of experience in
the several areas needed for a reciever...parts engineering, RF, digital

signal processing, PC fabrication, ESD protection, MIL-STD certified soldering, etc. I did a quick sketch of a receiver I wanted and produced a parts list. Even without minimum buys and availability, and so forth, I found that it would take about $350 to $500 for one without the case, knobs and pretty things. This assumed that I did the CAD and had the negative produced locally ($5 to $15 depending upon their mood)> I looked at the surplus market and found several as good or equal in this price bracket.

Although I would enjoy building the receiver, I enjoy using it better. I figured it would take about 6 months to 1 year depending on the time I could get free from my other activities.

I had experienced this before when I upgraded a BC-342N by replacing a couple of tubes with plug-in modules with miniature tubes..."modern tubes" which were about the same size as the existing tube had two or three sections which could improve things a bit. It just wasn't worth the effort. This was about 35 years ago and I wasn't and "expert" in the area.
Ralph

Most parts come off pretty easily with a hot-air gun. You have to play
with the temperature and time a little. For delicate stuff, grab it
with tweezers while you heat. for ordinary rugged ics, turn it upside
down. Heat it up and give it a whack. The parts will fly off.
Wear eye protection.

It's in the manual, if you have it. Sorry, mine's in the car right now, and it's raining out. If you don't have the manual, send me back an e-mail and I'll get back to you in a day or two.

It's something simple like holding down the F key and the Shift key while turning on the power switch. Coverage is then from 137-174 MHz (FM only). You cannot save the out-of-band freqs in memories, though you can keep them in the 2 VFO memories. I think that is a feature that they added to the HTX-242. I believe that extending the range also allows TX on MARS/CAP.

Get yee down to the local engineers book store and
pick up an introductory statics book and a materials
reference book of some kind. Most everything you need
to know will be there. The calculations aren't difficult.
As for the base, you can take a look at a soil mechanics
book, bang a pipe into the ground to test and scale to
meet your needs. As an alternative you can check with the
folks that sell the aeromotor windmills. If I recall
correctly, they have plans for folks who want to build
there own windmill towers. Last of all, for a cookbook
approach, see if you can dig up an old riggers or
millwrights guide. Plenty of plans these.

If Don hadn't mentioned this, I was about to! You can also homebrew
a direct conversion receiver, without buying the board, if you really
want.

: A comment about "knowing what frequency you are on". I have no tuning
: dial

If you _do_ feel a need to know your frequency, the very simple way is
to count it. In a direct conversion receiver, you just count the
local oscillator, and that _is_ the frequency...plus or minus any
offset for the audio tone of a CW or FSK signal. But for sideband
or AM, it is just the carrier frequency. The counter should be either
very well shielded, or able to be turned off, because you will find
it generates lots of RF "hash."

Finally, I know Don has started some experiments with using DDS chips
for the local oscillator for a DC receiver. It seems like they'd
offer a way for "digital" type people to generate a decent LO, and
know what frequency it's on just from the digital info sent to it.
Perhaps Don can offer comments if he's had time to get anything going.
(Hope I'm not getting you in trouble here, Don!)

Hi Greg OM,

I have lost track of the original poster, so I hope this can reach him
and my apologies for using your post as a conduit!

I have been hamming and tinkering for over 42 years, and it is my observation
that it has never been easier to build a good performing receiver than it is today!
One way to do it is to simply buy a PC board for the "R2" phasing type direct conversion receiver described by Campbell in Jan 93 QST (and duplicated by hundreds, including myself). Remember, the receiver circuitry is
almost all AUDIO, since this is where all the gain is located in a DC receiver. (Almost) anyone can build this receiver, and a simple VFO for the local oscillator. I highly recommend anyone not familiar with the
phasing method of generating SSB to review it (it has been around for many
decades), as well as the article. The R2 has outstanding performance, (mine hears 1 uV on 40M, has over 110 dB dynamic range, has 55 dB of opposite
sideband suppression), can cover the range of LF to microwaves depending on
the input mixers, has beautiful audio quality, is a very flexible building block, and fits on a board 3.5 by 4.5 inches or so. Take a look.

A comment about "knowing what frequency you are on". I have no tuning dial
or frequency display whatsoever for my homebrew TX and RX, which I use on CW and FSK (amtor and pactor). I have never found it necessary to have
a frequency readout. I can tell when I am in the band or not, and that is really all that matters. Mind you, I am talking about "need", not "would be nice", and I am talking about general ragchewing operation
Have a net frequency you want to get on? Find it once
when the other station is on, and then mark your tuning knob for that frequency.
That always gets me close enough, although I am strictly a random ragchewer,
not a BBS user on FSK.
When I am in a QSO, especially on FSK, I am often amazed at the importance
other ops place on frequency readouts, to the nearest 0.1 Hz. For example, I have
had several ops ask me, while engaged in a Pactor QSO, how I can operate without any frequency readout. I then ask them (answering a question with a
question): "What frequency are we on now?". They might say "7071.5051 KHz".
I then ask them, "Is that your mark or space frequency?" or, "What is the carrier offset

in your rig when using the CW I.F. filter in FSK mode?". Those things have
to be known to determine what the frequency readout is really telling you. I have yet to
work more than a couple of ops (thousands of QSO's over 13 years), who could answer
both of those questions. So, what is the significance of all those digits there
on the frequency display? They are significant only if you know what they are
telling you, and what they are not.

Lastly, I would also suggest what has already been suggested by others: Buy an
existing receiver (transceivers don't cost that much more) that is NOT working
(prices get better that way), and fix it. You will learn almost as much as
building from scratch, with no metal work, painting/layout or other fabrication
to do. Just the fun stuff: circuit debugging and modifying.

I believe it went out of production in 1977.
(Or maybe that was the 1722).

>Any idea's on the value of this instrument today?

It would depend on condition, since they are virtually
unrepairable. They weren't very reliable even when new
(I used several over the years). In the rare event you
had one where everything worked perfectly (and the CRT
wasn't dimmed out as usual), it might be worth as much
as $300. If it has any problems, the value plumments
precipitously.

The two terminal ones are cheap replacments for quartz crystals,
used for the timing oscillators in a lot of consumer gear like
TV remote controls, CD Players and the like. Maybe you could
use it for a BFO, but not as a bandpass filter.

Check out the Digikey catalog, they sell both types.

Homebrewers: As a recent successful receiver-builder, I feel obligated to jump in and encourage others to share in the fun! Its just not that difficult! I agree that a super-het is probably not a good "first HB project" but you don't really need to be a very advanced and experienced builder to produce a very useable receiver.

Over the years, I've heard may very technically comptent hams say that "transmitters are fun to build but receivers are too hard." Maybe this comes from the old days when some of the modern components were unavailable. I'm not sure... but I don't think its true anymore.

I just completed a version of Doug DeMaw's "Barebones superhet" for 20 meters. Real simple: Mixer circuit, VXO, one IF amp, product detector, AF amp. For the IF filter I used one 3.579 Mhz computer clock crystal with a resistor to ground. The rx is very stable, very quiet and very sensistive. I can easily copy lots of DX SSB sigs with my "in-the-trees" dipole. This is only my second major Homebrew project (the first was a transmitter) but it only took me about a months and I don't think I spent more than 100 dollars.

For ideas check out the June 82 issue of QST or look at the 75 meter SSB reciever that Doug DeMaw has in the "QRP Classics" book.

Have fun! Fear not! Good luck!

Hi
I suggest you either purchase a used receiver or build one of the kits available through various suppliers (try ac6v's page at http://pw2.netcom.com/~ac6v/pageas.html..try the topic "kits").

As for the coax, short one end of two seperate but equal lengths and fasten the braid onto an insulater...i.e. a piece of plastic cut from a pop bottle...and use another length to connect it to ur receiver.

Good Luck and have fun.

Rod

Source record: 92296

Hi, I've got for sale on Ebay's Auction Web:
Antique Tube Radio, Lafayette, Pre WW II. The outside case is basically shot. It has the face plate marked with Lafayette and has 2 swastikas, which is what leads me to believe that it is pre- WW II. It has a plate affixed to the back of the chassis marked G7417, which I believe is a serial number. It has 5 vacum tubes, they are marked as follows:
2 are 35-51, 47, 24A, 80. I think that each number should be preceeded by a " G ". All the tubes are Wards Super Airline except the 80 which is Nat. Union Electic. The unit will power up and all the tubes glow. I ran it for 5 mins. It didn't catch fire, smoke, or smell, also it didn't produce any sound. The original case is a round top (cathedral type?). Buyer pays 18 lbs. S&H, Please e-mail me with your zip code for acutal shipping cost.

# 1345. FD3 question

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-25 00:00:00 UTC
From: franky B <frankyb@glo.be>
Message-ID: <33D93785.2956@glo.be>
Source record: 92300

Hello tnx for reading this message.

a few day ago I bought an antenna FD3, it's a wire antenna from abt 20M

Now i have 2 possibilities to install it.
1. in one line from north to south on about 8m
2. in north - south east with the balun on 12m but as inverted V

what's the best way to do it...?

tnx in advance

# 1346. HP 1720A scope

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-25 00:00:00 UTC
From: Eric Beck <ericbeck@lucent.com>
Message-ID: <5radv5$c2o@nntpb.cb.lucent.com>
Source record: 92301

Hi -

Does anyone know the approximate age of the HP1720A
scope design? This was a portable dual trace scope with
275 MHz bandwidth.

I was unable to locate the the literature
on this product at HP's web site, which goes back to the
early 70's.

Any idea's on the value of this instrument today?

Thanks,

Eric Beck

Hi James OM,

Judging from the context of your post, I suspect you may have never seen a
100 foot tower. First, I would look around and find examples of even smaller
towers, and examine closely how they are built. That alone will give you
a real-world idea of what is involved, to just duplicate an existing design.
However, home-built towers have been successfully made in all kinds of shapes
and sizes and materials. A friend of mine welded up (and had hot-dipped galvanized),
a 60-foot tower which he then mounted into the top of a 100 foot tower, and used
as a rotating mast to hold stacked yagis for the 80M thru 70CM bands. He also
made all his own yagi arrays, including a full size 80M 3L. And he did all this
work alone.

73,

Don, W6JL

Building a 100 ft tower isnt something I want to tackle! The stress at the lower levels of such a structure are HUGH! Buy a nice used tower.

> <snip long list of negatives>

Well, there are receivers and receivers. Certainly a high-performance SW receiver is a serious undertaking, but there have been quite a few relatively simple single and multi-band SW receiver projects published in QST, 73, Pop. Electronics, etc. Some of which provide quite reasonable preformance.

I'm not really trying to argue with you. If the original poster is more interested in listening than building, then scrounging a good, used SW receiver is probably the best advice. Well, that and putting up a good antenna. But I for one enjoy throwing solder even when, sometimes, my ambitions get ahead of my skills. After all, one does not become a tested solder thrower without throwing solder.

To the original poster. The closest thing in the amateur radio community to a 'Radio Receiver Building for Dummies' book is the Amateur Radio Handbook from the ARRL. There are also some other good books like the 'W1FB QRP Notebook', etc. Check out the ARRL site at http://www.arrl.org, you'll find books listed under 'ARRL Publications' under 'ARRL Products and Services'.

From the spec sheets they look close - it's not clear what the difference is.
Go to www.semiconductors.philips.com/search/ and search on 602 to find specs
and ap notes on the NE/SA602 (and other misc stuff with 602 in the part number).
Then do the same on 612.

Good luck

Hi Gang!

I'd like to take a minute to invite you to stop into the Central Michigan Amateur Radio Club's Web Site, as well as the KB8TNQ Ultimate Amateur Radio Page! as soon as you can.

The first Site, CMARC's, is located at: http://www.kb8uyz.com/cmarc and offers information about our club. Additionally, and perhaps our biggest addition to the Site, (The "Trader's Page") offers FREE SPACE for you to post your items for sale. The guidelines are posted, so check it out.

The second, KB8TNQ's Page, is located at: http://www.kb8uyz.com/kb8tnq and is a great source for those in the hobby and those who are looking to get into Amateur Radio. With links to many other great sites, you'll have to stop in to check it out.

Thanks for your time and be sure you leave your comments and URL in the guestbooks, as we're always looking to add new ones.

7-3,
Jim KB8TNQ

## 1362. PS upgrade/repair kit for Drake L4/L7 PS

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-26 00:00:00 UTC
From: k9sqg@aol.com
Message-ID: <19970726212001.RAA00104@ladder01.news.aol.com>
Source record: 92226

Have collected parts together to rebuild or upgrade the Drake L4PS or L7PS. All parts are new. Included are 250 mfd capacitors (25% more than originals for improved regulation, cost over $15 if you can even find them), diodes (3A @ 1000v, not the 1A 600v standard in the L4PS), equalizing resistors for the capacitors, equalizing resistors for the diodes (if your supply uses them), a 30 watt ALC resistor to replace the 7 watt original (when it blows it puts HV on the ALC pot and blows it, has not been available for over 10 years for the L4B), bleeder resistors, 0.82 ohm "fuse" resister, and a 220v muffin fan (run on 110v for super quiet or 220v for max air) to really keep things cool. Total for all parts is $115 plus UPS extra, conus only.

Capacitors are new, computer grade with screw terminals, I adapt them with a wire down the side for essentiall drop in replacement with the originals.

Thanks.

Evan

# 1367. Re: IC's and other sh!!.

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-26 00:00:00 UTC
From: Gene <genespeed@sprintmail.com>
Message-ID: <33DACD69.17CB@sprintmail.com>
Source record: 92231
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.cb,rec.radio.amateur.equipment

Use copper braid and hope like heck you don't lift a trace up.
Buy a cheap butane (Buffalo Tools-5 bucks) torch and hope against the
above with the addition of hoping you don't remove other surface mounts.
Spend big dollars on a specialized hot air device.

or...

Find some old boards and pratice!
Use some liquid flux to help speed up the flow when using braid.
Dental picks work great for one leg at a time removals.
Beware the glue when done with all the pins.
Well spaced pins and/or componets with cheaply done solder process-
use the braid and gently lift.
Postage stamp IC's with very narrow spaces and excellent solder dip
process- use hot air or torch.
Use tweezers (various types but use what is comfortable to your grip)
to grasp a cap or resistor surface mount and go back and forth with
a soldering tip untill you can lift it up with a gentle pull.
The above will obviously leave solder behind so when you install a new
cap or resistor in it's place just pin it down with the tweezers and
reverse the process.(removing the old solder is a waste of time)
Practice makes perfect.
Gene (15 years as a consumer products technician,CD's,VCR's,Camcorders,
CB's,Audio stuff Home and Car, I've seen it all in surface mounts, and
screwed up many (hardknocks). Every part is unique and requires that
special handling and/or technique to remove it - there is no single
proper way to answer what is the correct way)

## 1368. Q: Info on toner transfer using label stock

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-26 00:00:00 UTC
From: jdc@cci.com
Message-ID: <EDy6Ko.IJC@sunsrvr6.cci.com>
Source record: 92232

I saw a web page describing the use of some type of label stock
for toner transfer PC board construction. It sounds like a
cheap alternative to Press-n-Peel and those other $1 a sheet
toner transfer papers. Unfortunately, I didn't save a bookmark.

Anybody run into this, and have the address handy? Or remember
the type of label stock?

Take a wire about 60 ft long, and string it out your window.
If you have 1--T, just short the jacket to the center at both
ends and call it good.

Take another wire and hook it to a good ground, preferably
NOT the water system, but one in the ground if you can.

Take a piece of Galena crystal from a rock shop ($0.50?)
and solder a lead from it to the ground. Mount this on the
middoe of a piece of 1 X 4 board 6 inches long.

Take a 2-inch safety pin and bend the head at right angles
to the body. Screw this to the same board close enuff to
the galena that the point can be bent over to scratch LIGHTLY
against teh top of the galena.

Attach a wire to the same screw as the pinhead. run this wire
to one side of a headphone, the lighter the better, such as one
of those that come with the shirt-pocket receivers. attach
another wire to the other side of the headphone, and run that
wire to the antenna.

put the earphone in your ear.

WARNING ! NOT DURINT A THUNDERSTORM !

Just thought I'd mention.

Give a listen, while you fondle the pin. The sdratching will
help tune it.

When you have done that, and gotten a signal, you may
wish to add a small, broadband amplifier. They, too, are
easy to build.

Then you may wish to add a tank circuit to filter out all but
one band.

Then go back to eht books and you will have MUCH less
trouble trying to see where to start.

You willl have the confidence of having FIRST BUILT, then
NEXT, MODIFIED (redesigned) a receiver.

After that, the world is your, er, ah, shellfish.

Good luck

>
>David
>KE4ROB

May I suggest?

1) go to used book stores until you find an older ARRL handbook.
they have simpler tuner projects.

2) call or write Fair Radio in Lima Ohio, and ask if they have a TU
-9B or lower. If less than $50, get it, and you willhave most of the
project. The TU (Tuning Unit) comes off the WW2-era BC-365
or something like that.

3) look in ARRL handbooks for a simple project that will help y9ou identify
the major parts and placements of your tuner, and rewire the TU to
that design.

Then enjoy, and start thinking how to redesign it better yet,

That way you will have all the fun of total lhomebrew, plus the fun of
traditional exotic elitism, plus you will learn a whale of a lot, which is
a big part of the fun of ham radio.

Also, this is something you can re-do over again as you get better.
It will laast you many years of use and rebuilding, if you treat it well.

It's a thought.

You DID say you'd rather build, right?
You might look into Strip-Line filters and Band-pass,
and Band-reject, and cavity filters, and after you have
read up on those, you might seek in the past indexes of
electronics magazines for how to make them out of the
commonest materials.

F'instance, I made a cavity duplexer, once from 1-lb coffee cans.

For lower freq's, it might take a couple washtubs and a sheet
of tin, but shouldn't.

For lower freq's you can go to Band pass and Strip line.

I have a 2-meter and had a 6-meter filter.

The first is a 12-inch piece of 1/2-inch copper water tubing in a Bud box.
Courtesy of ARRL handbook, and probably in the British book also.

The second was a stripn of brass, and other stuff in a Bud box.
Cost me about $3. All junk parts.

Hope this helps, and good luck.

## 1378. DC Rx post-mixer diplexer frequency?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-27 00:00:00 UTC
From: Leon Heller <leon@lfheller.demon.co.uk>
Message-ID: <rWRODFAZ5z2zEwQA@lfheller.demon.co.uk>
Source record: 92242

In a DC Rx with a diode DBM, what frequency should the diplexer be designed for? I was thinking of about 9 KHz, as this is about three times the audio image frequency, but Rick Campbell's Mini R2 seems to use about 6.6 KHz, working back from the component values.

The two-lead ones used to be used in place of the decoupling capacitor
across an IF amplifier transistor emitter resistor. Alternatively, they
could be used with appropriate capacitors to make cheap ladder filters.
I did this many years ago.

the ceramic resonnators are fine for oscillators, and they may be
pulled more than comparative xtals. I am sure you may use them for
filters, I have seen a BP-filter for 7MHz band using such devices

I posted some info on a newsgroup some times, but obviously this
attracted little interest or nobody makes any experiments any more?

I have made experiments with oscillators using ceramic resonators for
250, 480, 960kHz, and 3,58, 4.0 MHz
it is easy to pull a 3.58MHz element to cover 3.5-3,6MHz in a VFO
An oscillators using ceramic resonnators should have some 3 times
higher capacitor values than xtal oscillators to operate
satisfactorily

James, before starting to build the tower have you got the space?
I think you need to give a few more details before any sensible
answers are to be expected.
Is the tower to be self supporting or guyed?
Self supporting towers like electricity grid towers are major
constructions and not to be taken lightly.
Guyed are possible to construct but will require a large area
of ground to place the guy anchors in.

I have seen a 100 foot tower made of special triangular extruded
aluminium built and erected. The sections are 10 feet long and bolted
together with corss bracing like a lattice. Each 10 foot length is
bolted to the next until 100 feet reached. You will also require a
*gin* pole to enable you to pull the thing upright. That will have to
be at least 60 feet in length. So you will need a 100 foot tower and a
60 foot tower. You will laso need a gin pole to erect the 60 foot gin
pole vertically at the end of the 100 foot tower. That means you will
need a gin pole for the gin pole erection. That secondary gin pole
needs to be about 10 feet long.

You will need guying at about 20 foot intervals up the tower and at
least four front/back/left/right .

I suggest you re-examine the need for a 100 feet tower. You did not
say what the purpose was. Perhaps you do not need quite as high?

Best of luck in the construction.

## 1390. Wanted: circuit for low power transmitter

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-28 00:00:00 UTC
From: Mike white <m_white@juno.com>
Message-ID: <01bc9b72$0f0fc500$54b31d80@mm59049-pc.mitre.org>
Source record: 92162

Hi. I'm thinking of a small transmitter project for portable use. I have a nice portable receiver, and would like a transmitter with the following characteristics:

20 or 40 meter cw, preferably both bands
10 watts or so (not quite QRP)
VFO control over cw portions of the bands
Reasonable stability and keying
Compact size, suitable for portable use
Operates on some reasonable voltage, like 6 or 12 VDC
No hard-to-find parts

I have in mind a final package about the size of a small book, that I can carry in my luggage, and use with a simple dipole. Can anyone point me to a design or schematic for a transmitter that fills the bill? Thanks.

# 1392. Minicircuits ERA MMIC at 10GHz? ...

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-28 00:00:00 UTC
From: mramos@originet.COM.BR
Message-ID: <199707281343.KAA12002@netra01.origin.com.br>
Source record: 92164

Hi all. Thanks for reading this:

Does anybody has any info on any ERA's performance at 10.5GHz? I saw some Minicircuits PDF files that has some plots showing 10.3GHz performance. The published "S" parameters data reach 8GHz and I extended them to 10.3GHz based on this plottings, in order to symulate the circuit using PUFF software.
The Idea is to use a pair of them as a post-mixer TX pre-driver and L.O. amplifier (a 10GHz xverter using DEM building blocks is under construction). Simpler than the original DEM modules, more or less the same gain/nf, NO BIAS circuits ...

Thanks on any info.

I've found many sources for homebrew transceivers, but I'm looking for recommendations... from personal experiences, what works and what doesn't? Can I throw together a 80-10m hf cw station for under $50? Can these homebrew projects utilize linear amps so that I can put out 100 watts or more? Is it worth it all to build my own transciever? (I'd like to build one with a digital display and I've seen many kits and schematics with parts lists)

I'd appreciate any help I can get and recommendations !!!!

thx 73

There's all kinds of stuff out there in the literature. Transmitters
are easy. Good receivers are tough. But they all work, to varying
degrees. You might start with _Solid State Design for the Radio
Amateur_ and _QRP Power_ as sources of ideas. I like KK7B's
designs, and think the Norcal 38 Special is cute; your mileage
may vary.

> Can these homebrew projects utilize linear amps so that I can put out
> 100 watts or more? Is it worth it all to build my own transciever?
> (I'd like to build one with a digital display and I've seen many kits

Of course they can. Were you planning to build the amplifier too?
Whether you plan to or not, you must build an excellent transmitter,
because 100 watts or more means your signals must be that much
cleaner.

What do you expect to get out of this project? A single-band
transceiver can be a fascinating and rewarding project, but
multi-band gear is tough to get right, even for experienced
builders.

# 1395. Re: DC Rx post-mixer diplexer frequency?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-28 00:00:00 UTC
From: tomb@lsid.hp.com
Message-ID: <5rit0q$129@hpcvsnz.cv.hp.com>
Source record: 92167

Leon Heller (leon@lfheller.demon.co.uk) wrote:
: In a DC Rx with a diode DBM, what frequency should the diplexer be
: designed for? I was thinking of about 9 KHz, as this is about three
: times the audio image frequency, but Rick Campbell's Mini R2 seems to
: use about 6.6 KHz, working back from the component values.

I've been doing some thinking about this question in a bit broader sense for a while, but haven't tried to put theory into practice yet. I've laid out some of my ill-conceived plans below, and welcome comments on them.

I think the answer for the limited question posed by Leon lies in the flatness you want in your audio response; if a 50 ohm load is presented to the mixer at all frequencies, the mixer "won't care" what the cutoff frequency is.

Then the question is what response you should want, and why you would limit it to be less than DC to light. For voice communications, I think 300Hz to 3kHz is the normally accepted desired bandwidth. You might want to have a filter that has a bit higher cutoff frequency than this at the front end, because it's not a very high order filter and doesn't have a very sharp cutoff...so to get the 300-3k passband flat to, say, 1dB, you'd need a higher cutoff in the filter.

Something I've done in my professional work in a similar situation is divide the many poles of the filter I want to build up into groups, and implement each group as a separate set of R-L-C components (or active filter sections or even digital filter sections). So, the leading filter might not be a "Butterworth" or "Chebychev" or "Eliptical" but would implement just two or three poles of an overall Butterworth (etc.) response. There can be quite a bit of math involved in figuring out the R's L's and C's for such separated filters, especially if each section implements several poles. But the result is an overall response that's much "cleaner" than you can get by cascading simple Butterworth (etc) three or four pole filter sections.

For a DC receiver, though, my thoughts--my plans--are to have the cutoff of the post-mixer filter be rather high...a few tens of kilohertz. It will be followed with a preamplifier which has distortion products for signals in that band on the order of 140dB below the signal levels. That is, it will be an extremely low distortion "audio" preamp. And it will be low noise, too...it appears that somewhere around 0.6 nanovolts/rtHz is possible. I'd like to then digitize the "audio" with a 24-bit stereo delta-sigma ADC, and process the result in a DSP for sideband rejection and detection of various modes (and fine-

tuning??)

But getting back to filter cutoff...it seems to me the reason to limit the bandwidth going into the next amplifier is to keep that amplifier from being driven to the point of causing distortion products that interfer with the desired signal. If the amplifier can have low enough distortion out to high enough frequency, then the filter can have a higher cutoff frequency.

Comments on all these ideas are most welcome, especially before I go off building much hardware.

On a related topic: I have a nice Watkins-Johnson diode DBM whose data sheet suggests that (at least in some sense) better performance can be obtained by terminating the mixer in a short at the image frequency, rather than terminating it in 50 ohms from DC to light. Does anyone have comments on that? It would be a lot easier for me to build a filter whose input impedance dropped below 50 ohms above the filter cutoff frequency, and this data sheet suggests that might not be a bad thing to do.

Also a note about impedances: for what it's worth, I measured a MiniCircuits level 7 DBM for IF output source impedance. It was roughly 10 ohms greater than the source impedance I used to drive the RF input port...so about 60 ohms with a 50 ohm source. It was nearly independent of LO port drive level, so long as the drive level was above about 5 dBm. It increased as the drive level was decreased below this level. This was done with RF and LO ports driven with signals around 10MHz, producing a nominal 1kHz IF port output, terminated in 50 ohms. (It was measured using an HP35665A Dynamic Signal Analyzer and math functions, with inputs driven by an HP3326A Two Channel Synthesizer. Hope this doesn't sound too much like an ad for our equipment; I don't really intend it that way.)

Source record: 92168

The real reason for terminating the mixer at the image frequency is to keep ALL the ports from jumping all over the place in impedance. BUT. To terminate the DC receiver at it's image is audio (the other side of zero beat.) If you want the 3 dB advantage of killing the stuff on the other side, (Noise), then you need to terminate the mixing products in I and Q separate 90 degree channels. Just what was done with the little R-2 derivitive. I haven't kept up with it due to lack of interest, but glanced at the articles when they appeared. They exist over the last couple of years in QST. I can't see where terminating the mixer at 6 or 10 KHz is going to buy you or the mixer anything.

tony-

Ceramic filters are essentially the same as crystal filters. The 3 leads connect to a network of resonators inside, that are probably surface-mounted on a ceramic substrate.

It may be possible to build a filter using several discrete ceramic resonators. However, I suspect what you have may have been intended for a different purpose. One example of a single-resonator application, would be as part of an FM detector. Another would be as a BFO frequency determining element.

To use your resonators, it would be a good idea to try to find some information about their characteristics. Is there a manufacturer's name and/or part number stamped on them?

> tomb@lsid.hp.com

Hi Tom,

You devil, you. (No, just kidding).
Regarding DDS. Yes, I have a DDS VFO running for my R2 receiver (will
work of course for
any receiver, DC or superhet). In on-the-air use, I cannot tell any
difference between using it
and using an analog VFO. For those of you who do not know what DDS
stands for, it
means Direct Digital Synthesis. You can now buy a chip, such as the

AD9850 from Analog Devices,
which is smaller than your small fingernail, SMT, and can generate any
frequency in the HF
range (125 MHz crystal clock is required to run it). A VFO can fit in a
shielded enclosure
which is a one inch cube. This eliminates analog VFO building (no tuned
circuits, no drift
problems, no limited tuning range/bandspreading, no mechanical
reduction drives and double-bearing capacitors). I am currently working
(subject to summertime interrupt projects like painting my 1200 feet of
3-rail fence) on a rotary-encoder to vary the frequency instead of using
a
computer (ugh) like I am now. This is one of the bases for my comment
that
it has never been easier to homebrew a receiver than it is now, and it
is
getting easier all the time.

73,
Don, W6JL

>the type of label stock?
>
>73..Jim N2VNO

Hi Jim

This is easy!

Get hold of some standard laser transparency sheets, they are easy to
obtain. You don't need expensive sheets of dedicated pcb ones.

You need to print on them so that the PCB layout will come out the right
way up. The idea is to make a sandwich up like this

iron
|------------|

==================== transparency
-------------------- ink side
==================== pcb copper

Place a sheet of kitchen tissue paper, or something similar named in
your country on the transparency and then place a WARM iron on the top
of the sandwich, This will heat up the ink and melt it to the copper.
Leave it to cool then GENTLY peel the transparency off leaving the ink
on the copper.

tip; make sure the copper is clean, give it a good scrub with a pan
scourer!

I have transfered some really fine pcb tracks using the above method inc
a layout for a 3.4 ghz transveter!

73 Simon GM4PLM

Good luck!

It would be a pretty neat transformer that could handle the DC.

How much current do you need, and how much do you want to spend? One simple way is to buy a 12 VDC to 120 VAC inverter and plug a "wall transformer" into it. Wallmart recently was selling low-power inverters for under $50, and a wall transformer capable of several hundred milliamps is less than 10 bucks (I think(?)).

Opps!!!!! Somehow missed the "DC"...

Another Idea, depending on the power required (not too much)... Use a
60 Hz osc. driving a automotive audio amp. Set input level for 9VAC
out. An ALC circuit at the amp input, sensing the output would provide
regulation if needed.

## 1405. Linear amp output meter adj?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-28 00:00:00 UTC
From: Don Hamiel <d308@pacbell.net>
Message-ID: <33DD634A.3C9B@pacbell.net>
Source record: 92177

I have an old SBE SB1-LA amplifier. It has two meters, one is output and the other is current. The problem I have is the output meter is reading a lot less than it's really doing. On 20 meters for example, The meter reads appx. 200 watts or "2" on the meter. However, when going through a wattmeter it shows roughly 500 watts. Is this normal? I've only had the amp a few months. I had to replace a filter cap after one blew up. The amp uses 6ea, 6sj6 sweep tubes. Is there any way to make the meter read a little more true and will it read true on all bands?

Any help? thanks..de Don N6NLX.

I believe the original quest was to retrieve goodies from the board at the expense of the board. No need spending 10 minutes taking a crummy 15 cent part off a board if the board is tosser when the good stuff has been scraped off these high tech transportation and storage boards....But as noted, these old boards are great training grounds for developing the skills in doing surgical removal...each technique noted, sans the blowtorch and my American beauty 250 watt scalpal can be learned to such a degree as to be useful in repair and replacement of boards that cannot be sacrificed to the IC god....

just a couple of thought..

## 1410. Posting Parts for sale

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-28 00:00:00 UTC
From: Bob Miller <bmiller@calweb.com>
Message-ID: <33DD4DB5.1738@calweb.com>
Source record: 92182

Given that parts are a major problem facing we mates who like to roll
our own gear, I wonder if the posting of parts and associated assemblies
should be posted to this newsgroup rather than to the broader based
rec.radio.swap or audio marketplace.? As I have noted this past year,
I am cleaning out may cubic feet of my excess toys, mostly radios, test
equipment and audio related things. I am now beginning the painful
process of thinning out all the parts piles I have been accumulating
these past three decades for so many beengunnas that at age 55 I have
face the reality of not being able to get around to all of 'em even with
my reasonably good health...
I have posted a couple of items recently on the home brew newsgroup
with a relatively low bow upon entry and would just as soon bypass the
genuflect ions and just get the stuff posted. I will abide by a
majority view on this question......

Thanks for the read es 73

Don, I run a FM repeater on 921.1125 Mhz (I'm a no code tech.).
I have modified several commercial 800 Mhz. radios to operate in the 900
ham band. The Repeater antenna is the comet FP-19. This is about the
only antenna I could find for less than $1000. Height is about 250'
power 10w range about 17-20 mile radius. I know this info doesn't help
much with your situation but i thought you might like to know what else
is happening on the band. 73 Chris N9LLO

In I/Q type receivers (such as the R2) you want to have identical phase and amplitude response in both the I and Q channels, in order to be effectively be able to cancel the unwanted sideband in SSB reception. If you have the filter corner frequency close to the wanted audio passband, you will also have phase variations that extend down to the audio passband. Due to component tolerances, you have slightly different corner frequency and slightly different phase response that also affects frequencies in the audio passband, giving different phase response in the I and Q channels. Moving the corner frequency well above the audio passband will affect the absolute phase response in the audio passband very little and also the differential phase response is small (in the audio passband) for reasonable component tolerances.

In the R2 design with passive RLC diplexers, you have to find matched pairs of components for the I and Q channels. Capacitors are easy, since you have to match the capacitance. But the inductors used have quite large (DC) resistance, so you have to find inductor pairs with both matching inductance _and_ resistance. Moving the corner frequency well above the audio passband, it should be sufficient only to match the resistance of these (lossy) inductors.

Increasing the corner frequency will also increase the total signal amplitude in the preamplifiers. In addition, with a corner frequency of, say, 10 kHz and a slope of -6 or -12 dB/octave, you can still expect to find very strong signals at 100 kHz (e.g. the broadcasting band starting immediately after the 40 m band) so you have to pay attention of large signal high frequency response of the preamp. It is no use of using 741 type op-amps with fT around 1 MHz, since at 100 kHz, the _open_ loop gain is only 20 dB and if you try to get 10-20 dB _closed_ loop gain out of it, the margin between open loop and closed loop gain is very small or nonexistent, so you can not expect the feedback to keep the distortion under control. Also you have to watch for slew rate limitations of the preamp. So it appears that you have to use a high speed, low noise op-amp (which is a rare and expensive combination) or you have to resort to different amplifier topology using discrete transistors.

If it is for a Commodore 64, I don't thing the 9VAC is needed(my Vic20 worked just fine off 12Vdc)
,but if it is,I'd build a 60 Hz sinewave oscillator,and feed it into an amplifier,then into a transformer.

Won't the stress at the lower level of the nice used tower be just
as HUGE ? Wherever the tower comes from, it needs to be properly
designed, constructed, and in good condition.

I like Walt's suggestion of a brick-built folly. It may be the only
way to get planning permission for a hundred footer in Britain. How
about getting a factory with a decent chimney? Stone-built would have
*class*.Just get to one ahead of Fred Dibnah....

Would any antenna to be mounted on an authentic Victorian folly or
chimney have to be made out of brass to be in-keeping with the period?

Cheers,
David GM4ZNX

LET'S SWAP boatanchors and/or parts!!

I am a ham hobbyist, NOT a dealer. I do this for fun,
not an investment!

I have a few things to sell/trade these days:

(Add shipping costs to all prices)

Vibroplex Presentation Bug - mint - $135.00

Eldico TR-75 transmitter. Classic 75m CW novice rig
with 6AG7-1625 line-up. Plug-in coils for 75m as supplied.
Originally used link coupling. Modified to pi-network, but
easily restored if you prefer. WIth manual, and in near-mint
condition, with covers. $95.00 plus shipping

B & K Model 701 Balun for 15 meters. 75 ohms to 100 ohms balanced.
Coaxial I/O to balanced I/O. Excellent $20.00

QTY 2 - mobile Approx 1945-era Motorola "Police Cruiser"
radio receivers; antiques, with 12K7 tubes and such.
No speakers. No manual or information. Great piece of radio
history! $20.00 each

James Millen Co. Model 90810 Transmitter - a CLASSIC!
This is a SERIOUS collectors' MUSEUM PIECE!!
11m, 10m, 6m, 2m bands with 3E29 final. EXCELLENT condition.
What a beauty. Copper plated chassis, Many refinements.
Inquire!

Hy-Gain mobile antenna / resonator for 80 meters. $10.00

Two BAKELITE clock radios as follows:

G.E. Model 535 (Uses the 12BA6, 35W4 tubes etc.)
Appearance good - untested - $15.00

G.E. Musaphonic, model 590 - with phono input etc.
Superheterodyne, uses 12AU6, 12AV6 tubes etc.
Appearance good - untested - $15.00

Tubes:
6GF7A - NIB
12AT7 Westinghouse NIB
12AY7 G.E. NIB
12AU7A by IEC NIB (I have two)

6GH8A Magnavox NIB
12AX7 RCA used (in box)
12AU7A Dumont - used (in box)
12AT7 Sylvania NIB
12AX7A RCA NIB (I have a few of these)
12AT7 RCA NIB (I have a few of these)
7025 RCA exc. used (in box) (I have 2)
12AT7WC ruggedized for JAN by Philips/ECG NIB
42KN6 Sweep tube, RCA used (in box)

Cornell Dubilier 2uF 3000V DC Oil-filled capacitor.
Other oil-filled HV capacitors available, inquire.

Lenox AM/FM radio digital clock radio (new)

A very LARGE 120V isolation transformer - about 1.5 kva
with taps, fuse panel etc. You figure out connections!
47 lbs shipping $50.00

MEMORY! Add 4 MB RAM to your IBM PS/2 computer!
4 MB 72-pin SIMM for IBM Proprietary MB - $15.00

Toshiba 4X CD-ROM drive XM5302B, untested - looks fine
With cable - $25.00

TEAC 4X CD-ROM drive CD-55A, untested - looks fine
With cable - $25.00

U.S Robotics WINMODEM 14.4 kB Internal modem with all docs,
diskette AND CD-ROM! For Windows 3.1 or WIN 95 only.
New, VERY nice - $20.00

Printer A-B Switch - New, with standard 37-pin Centronics Connectors.
Nice beige metal mini-cabinet. $7.00 each (have two)

16-bit sound card for ISA buss (PC compatible) computer
systems. Has IDE CD-ROM ports & cables. Mike input and
speaker outputs. Tested: Excellent. $15.00

Integrated Circuits:
339 14-pin QUAD Comparator
D8202A 40-pin
D8212 24-pin (I have 2)
P8155 24-pin
P8085AH (two)
MM53214GQK/N (20-A4592-026) 40 pin
30293E-026 (20-A4592-026) 40 pin
SY6545-1 40-pin
R6551P
D-2732A-2 EPROM (I have 1)
D-2732A-3 EPROM (I have 4)
27C64-G-15 EPROM (I have 3)
27C64-30 EPROM (I have 3)

D2764A-3
SRM2064C15 Dynamic RAM (I have 7)

I also have several linear and TTL/CMOS smaller
14 and 16-pin DIP chips. Inquire.

Bass Guitar - by Washburn - copy of Fender Jazz Bass. VERY nice.
Sunburst color, two pick-ups. MINT condition. Worth about $220.00

Acoustic guitar, Spanish - superior quality. Emperador
Model TC-80 made in Korea. With carrying case Truly a beautiful
instrument, and has to be worth at least $100-120

WHAT DO YOU HAVE??

The primary service is government. 170.245 is a specific freq allocated
on a secondary basis for wireless microphones.

## 1432. Recording & Playback

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-29 00:00:00 UTC
From: "Kevin E. Stroud" <kestrou@trigard.com>
Message-ID: <01bc9393$05a55c50$14000001@kevin>
Source record: 92193

Greetings all,

I hope somebody gets this (my ISP's usenet server doesn't have *any* messages from this group - is it active?). I'm new to Ham (OK, the truth is, I'm not really a Hammer), but what I would like to do is, I believe, related to Ham.

I would like to "record" the output of a handheld RC control device and then play it back and watch the little car do the same thing it just did (assuming the same starting position). Sounds easy, huh? I've looked at some Yaesu transceivers, but I'm not sure I can record the signal using them. I'm at the high end of HF - 27.095 MHz - but I'm not sure how "wide" my signal is (will I need to record using a DAT tape?).

Thoughts? Suggestions? Anybody done this before (I'm sure this isn't an original idea - too many hammers out there!). Any and all responses appreciated!!!

Source record: 92194

Hi,

Timeline has offered surplus Cellsite Transceivers for a while now,
and I took the plunge and ordered one. It is a nice unit, with 2 receiver
front ends that have a voting circuit to select the receiver and antenna
with the best signal. The exciter outputs 1.5W, annd the unit has
10 dipswitches to select the operating frequency pair, with provisions
for external contol.

The unit requires a frequency standard of 18.990 MHz, which I have
obtained the Mini Circuits POS25 VCO and installed in the unit using
12VDC from one of the units internal 7812 regulators and providing the
tunign voltage from a homebrew powersupply using an adjustable
regulator circuitcontrolled by a 10 turn pot with locking/counting vernier
dial.

Although the units were advertised with service manual, operating
instructions
schematics, etc...; all I received with it was 4 photocopied schematics
with
a good sampling of handwritten notes in Japanease. Many of these notes
and other references in the literature indicated a difference of opinion in
the
values of the input voltage, pin numbering sequence, output labeling,
etc.....

I am hoping to first get this up and running, then look into computer
control and
frequency agility experimentation. Has anyone reading this NG already
tackled
this project. If so, I would be interested in hearing about the results.

Thanks for reading,

Hi all,

I have an Astron 30A 12vdc power supply (RS35A may be the model number, I forget) that has developed a nasty habit.

Twice in the past week, during periods when the commercial AC power was going off and back on due to local thunderstorms, the power supply has malfunctioned. It had a small load (approx 1 amp) on it when this happened. I discovered about 2 hours after the storm that the supply had apparantly quit. Upon checking, I discovered that the heat sink was **VERY** Hot, and the supply appeared to be laboring under a high current load. However, after disconnecting each load, leaving the supply running, I discovered that the supply's output voltage was 0.76 volts with no load attached. It still appeared to be under a load based upon it's transformer hum.

Turning the supply's AC power off and back on corrected the problem, and all appeared normal. However, it got back into the same condx again a few days later after a storm. I have not been able to duplicate this state by quickly removing and applying ac power.

Anybody had a similar experience and have an idea as to the failure mechanisim?

Thanks,

Dennis

In the UK that part of the band is in the transmit section of the PMR band, with the RX section around 166MHz. I also know that the British military use AM on about 170.0125MHz.

Most VHF xtal-controlled rigs for the 2-meter band should be re-tuneable up there, possibly needing the odd capacitor/coil reduction if it cannot be tuned exactly. Replacing ferrite slugs with brass will often do the trick too.

I have some 2-meter stuff on my homepage, but it is somewhat limited (ZN414 receiver and a simple FM transmitter) for your application.

Dennis,
I als have an Astron power supply (don't remember the model...around 35
amp continuous, metered) and I had a similar problem (3/4 volt and
delivering current) The first few times it happened, I was able to reset
the problem by turning it off and back on, then one day that didn't work
anymore. I was lucky, it was under warrenty, and I sent it back for
repair. If memory serves, there is a crowbar circuit in there for load
protection. Supposed to protect the equipment from an overvoltage
condition by sensing and then shorting the supply. I think the crowbar a
SCR and another transistor were replaced. I have no idea whether both
were bad or perhaps they just replace both as a matter of policy.
My chief remberance of the incident tho' was how well they (and HRO)
treated me. And I had the supply back within a week and a half.
I would certainly buy another Astron supply, if only for the service.
Thinking back on the schematic, I seem to remember also that there
wasn't a lot of electronics to look at, and I would have probably
attacked it myself were it not for the warranty.
HTH.
73,
Stan kf0nc

most studio grade wireless mic systems are using it.
they get 4 "channelized freqs" and the above freq is one of them

Source record: 92203
Cross-posted to: sci.electronics.repair,rec.radio.amateur.homebrew

It was probably in overvoltage shutdown which probably turns on an SCR across the output when an overvoltage 'event' is sensed.

It could be that the sensitivity of the overvoltage circuit is set too close to the output voltage or that there is a genuine problem with the supply putting out excessive voltage when driven under extreme or changing line conditions.

It had a small load (approx 1 amp) on it when this happened. I discovered about 2 hours after the storm that the supply had apparantly quit. Upon checking, I discovered that the heat sink was **VERY** Hot, and the supply appeared to be laboring under a high current load. However, after disconnecting each load, leaving the supply running, I discovered that the supply's output voltage was 0.76 volts with no load attached. It still appeared to be under a load based upon it's transformer hum.

Turning the supply's AC power off and back on corrected the problem, and all appeared normal. However, it got back into the same condx again a few days later after a storm. I have not been able to duplicate this state by quickly removing and applying ac power.

Anybody had a similar experience and have an idea as to the failure mechanisim?

Thanks,

Dennis

Hmmm 9v AC? By any chance are you looking to run a video game in the car or boat? I agree with the gentlemen who suggested buying a DC to 120vac converter and then plug in a wall transformer.

But tell us more, perhaps your problem could be solved another way. For example if the equipment your trying to use is electronic in nature, it's a safe bet it has a rectifier and regulator inside. With 9VAC it's probably a 5v regulator if thats the case you may be able to directly supply 12VDC to the unit without any problems at all!

Need more details though. Tim, ka8ddz

Hello!

We've recently created a Technical Bookstore that focuses on titles relating to all areas of electronics -- including robotics, microcontrollers, radio and more. We are trying to find books that are outstanding in their field, not listing every title available.

We are looking for recommendations for additions to our bookstore. If you have any suggestions please e-mail them to books@itutech.com and we will review your suggestions.

Please see our bookstore at http://www.itutech.com/techbooks.htm

Thanks!

There have been several good responses to your question, but I'll add my two-bits worth. Although I've been told that the mixer needs to be terminated only at audio and perhaps at the LO carrier frequency, there are a lot of other frequencies which can come out of the mixer and disturb the audio amplifier. It's not difficult to make a simple diplexer which has a constant impedance at all frequencies but a single-pole lowpass rolloff. For example, a parallel RL in series with a parallel RC. Connect the mixer to one end of the parallel RL, and the audio amplifier to the junction of the two parallel circuits. Ground the other end of the parallel RC. If SQRT(L/C)=R=50, the mixer will see 50 ohms at all frequencies (until, of course, parasitics become noticeable).

Typically, additional audio filtering follows the audio preamp, so the main goal of the diplexer frequency rolloff, in my opinion, is to provide attenuation beyond where the preamp and following filters can handle large signals. But I don't see why not make it break just above the range of audio you're interested in, except that the component values get quite large. Rick's choice of 6.6 kHz seems to be a reasonable compromise.

Hi Dennis, I am very familiar with the Astron RS-35A power supply, that one has the large heatsink on the back with 4 2N3771 power transistors. What seems to be happening is the power supply has inside of it what is known as an "SCR crowbar". The crowbar circuit is tripped by an overvoltage condition, which fires a very large SCR that shorts the power supply's output. Instead of burning up, the power supply goes into current foldback and limiting, which kills the output and makes it

run very hot. The crowbar circuit should be on a smaller circuit board and attached to the supply's output terminals. Unless a failure on the crowbar may be tripping it prematurely, check for an adjustment pot on the board that sets the crowbar's trip voltage, you can put a DC voltmeter on the supply and adjust the supply's main output voltage (on the main regulator board with the LM723) until the crowbar trips about 16 volts. Other than that, you may have a problem with the crowbar, causing it to trip prematurely. I can help you troubleshoot the supply, please drop me some E-mail and I will help you. Hope this helps and good luck!:)

Joe at jef812@ix.netcom.com

P.S.>That Astron RS-35A is one hell of a good power supply, I used one to repair mobile stereo amplifiers, and it didn't even budge under the load!:)

Thanks for all the helpful suggestions.

I recently came across this circuit with a web search, which might be of
interest:

```
__C - L__
R - R
|
C L
____|_____
```

where XC = XL = R = 50, with Q = 1.

It's described as "a constant Z broadband bi-directional termination - a
simple alternative to the diplexer". I didn't note the URL, but it
should be easy to find it.

It looks like a useful technique for a conventional Rx. I might try this for, say, 6 KHz, for my DC Rx.

No. There are several monoband transceiver kits in this price range
but I haven't seen anything 10 to 80 meter for <$50.
Have you checked out the Dave Benson (NN1G) kits ?
www.fix.net/~jparker/sml.html
He has a couple of CW kits as well as an 80m/20m SSB kit.
I built the 20m SSB rig and recommend it !

Also, Dans Small Parts carries several QRP kits (URL not handy at this
moment). Dan also carries a good line of QRP stuff.

Alternately, you may want to ask around for a used Heathkit HW-8 or
HW-9. Now these are multiband QRP CW rigs. My HW-8 covers
80/40/20/15m. I was able to find one that needed a bit of repair for
$50.

>Can these homebrew projects utilize linear amps so that I can put out
>100 watts or more? Is it worth it all to build my own transciever?

Sure, you can build an amplifier. Do yourself a favour and pick up
the ARRL QRP handbooks (the old and new one) and look into the RSGB
library.

>(I'd like to build one with a digital display and I've seen many kits
>and schematics with parts lists)

Both Dave Benson and Dan's have rigs with this option.

Cheers, Hugh VA3TO

I'm NOT sure if the RS 35 is anything like the 20 Amp supply or not circuit wise as I've never looked at a schematic or inside of an RS 35, but when the power flickered, I lost two Astron 20's by way of the Bridge Recifier blowing. I know this may not have anything to do with the other, but two in one week after a couple of storms seems kind of odd for the same problem. AND, they were the ONLY thing that went out when the power flickered.

Just a tip to keep in mind for future reference......

# 1462. Simulation & Synthesis Capability for Ham Organizations

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-30 00:00:00 UTC
From: Kathy Goerg <kgoerg@webblabs.com>
Message-ID: <33DF5394.1AD4@webblabs.com>
Source record: 92128
Cross-posted to: rec.radio.amateur,rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.space,alt.ham-radio,alt.ham-radio.am,alt.ham-radio.amtor,alt.ham-radio.atv,alt.ham-radio.digital-voice,alt.ham-radio.eme,alt.ham-radio.exotic-modes,alt.ham-radio.fax,alt.ham-radio.fm,alt.ham-radio.hf,alt.ham-radio.marketplace

Many amateur radio operators have contacted us in recent months regarding availability of affordable electronic analysis and synthesis tools. We have now released Version 2 of the Professional Partnership (PP) Program. For the nominal one-time $975 charge, the PP program may be distributed throughout a club, organization or company. Of special significance is the profound level of Wireless/RF/Microwave capability included:

Nodal Circuit Analysis with True Two-Node Port Definition
Unconstrained Noise Analysis
Transmission Structure Synthesis & Analysis
Over 40 Single & Coupled Topologies
Strip (Planar) Structures
Wire Lines
Coaxial Arrangements
Waveguide (Non-TEM) Topologies
Passive Filter Synthesis
Lowpass
Highpass
Bandpass
Prototypes
Practical Reactively-Coupled Realizations
System & Receiver Design Support
Link, Terminal & Radar Analysis
System Architecture Characterization
Spurious Analysis
Transmit & Receive
Coincident & Tuned
Preselector & Output Filtering
Phase Noise Analysis
Time Domain Effects
Frequency Domain Effects

600+ Page User's Manual with Examples & References

Acquire a single PP Program package for your club, company or organization and you will be furnishing all of this needed capability to every designer, not just one! Our competitors are furious with us for having created the uniquely progressive opportunity. It seems they're still using dongles to hinder access to their own products.

Please contact me for additional information, or see:

2567 is a dual 567. It is normally prefixed with two letters like XR or
NE depending on the manufacturer.

> ,better find out what it is all about before hand.
>
> VE3CZN

The 170.245 MHz frequency is governed under FCC Part 90, 90.265.a/b. It is usable by eigibles (Sec.a; Power, Petroleum, Forest Products, Special Industrial, Business and Railroad Radio services) for low-power, wireless microphone operation subject to the following:
1. The emission bandwidth shall not exceed 54 KHz
2. Output Power shall not exceed 50 mw
3. Stability shall be +/- 32.5 KHz of assigned freq.
4. Unprotected from interference from other licensed operations in the band. If Government or non-Government users are interferred with, operations must cease. Also, applications are subject to Government (Federal; other than FCC) coordination.

Summary, if you're not one of the listed elgibles, its not legal. However, given the Friendly Candy Company's record of enforcement in the amateur bands, it's likely you could put up a KW wireless mic and never receive a notice of violation. Only public safety frequency interference is still treated as a serious matter at the Commission nowdays.

Hope This clarifies.

Regards,
Rick Tannehill, P.E.
Ariz. Dept. of Public Safety

## 1465. Surplus CRT source

Newsgroup: rec.radio.amateur.homebrew

Hi Folks,

I have acquired several old Motorola Spirit pagers model #
A03JVC2468AC which are set for 152MHz. They have several crystals
and five tunable coils and one tunable cap. What I am wondering is if
they can be reset for 155MHz as I want to use them as single channel
scanners.
Do I need to recrystal them or will they tune using the coils or do I
have to break out the soldering iron for more extensive mods?

Thanks

Astron has an option you can get that automatically resets the
crowbar circuit when the overvoltage condition goes away. You can
get it directly from Astron and install it yourself.
Had this problem with Astron supplies at a repeater site. Every
time a thunderstom glitched the power it required a trip to the site
to cylce power and get the supply back up. As far as I know, this has
not been needed since the option was installed.

A number of improvements have recently been made to "Novice Notes Online" - Australia's leading internet site to beginners to amateur radio. These include a new feature on setting up a shack, a link to the Amateur Radio Balloon Experiment and more.

Much of the material on Novice Notes Online is relevant to people outside Australia. Topics covered in detail include operating, homebrewing, VHF, packet radio, portable operating, DX and more.

Closely associated with Novice Notes Online is the Australian QRP Home Page. This includes information about QRP in Australia. As well, there are operating hints, thoughts on what QRP rig to build/buy and contest information.

Both of these pages can be accessed through the URL below.

>elsewhere too.

This is an old trick. There was a magazine article many years ago,
perhaps in "73" magazine, that told how to use the 28.322 modules.
They called them "Fireballs", and there used to be a "Fireballers"
net on that frequency.

I'm new to this ham stuff. I don't even have my license yet. All I do presently is listen to the local repeaters with my portable and study to pass my exam in september.

I need a vertical antenna from which I can get good performance. I know that quads or yagis offer a lot of gain but I have no rotor and I don't plan on getting one in the near future.

Now, according to the latest posts in the various ham NG, a J-pole is a lousy antenna. I had planned to build one sometimes this month. Now I'm not just sure I should. I heard about dipoles doing a better job. Is this true and where, on the Internet, can I get plans to do this ? Is there other omnidirectionnal antennas that can be built on a thight budget ?

On a 7-amp machine, I had a similar prob once.
I believe (speculate) that it was caused by a
voltage spike charging the filter cap(s) above
some critical point referent the regulators.

At any rate, I replaced the 27K bleeder resistor
on the caps with a 10 K and the problem went away.

Good luck.

Yes.

> No. There are several monoband transceiver kits in this price range
> but I haven't seen anything 10 to 80 meter for <$50.

He didn't say anything about kits, at least not in so many words.

It should certainly be possible for someone equipped with less than $350
worth of tools and test equipment to build an 80-10 CW transceiver for
under $50. The result wouldn't be feature-laden, or cosmetically
pretty, or be able to offer leading-edge "turnkey" performance in all
respects, but it could certainly work well with enough creative
scrounging. An interesting challenge, and not one that deserves an
answer like "No."

As noted by others, if you're looking for power for a C64 or Vic 20, don't waste your money, 12 volts DC will run a Vic direct and with a simple 5 volt regulator, all DC, the C64 will run nicely... many of us have been doing so for years. See the info on Commodores on my web page: http://www.arc.unm.edu/~jdport

According to an old Motorola reference, it's a general-purpose silicon
rectifier. 100 volts peak reverse working voltage, Io 240 amps, Ir 50 mA.
That's all it shows.

# 1489. QRP CW xmitter: Use a TTL oscillator module on a ham band

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-07-31 00:00:00 UTC
From: wa2ise@netcom.com
Message-ID: <wa2iseEE6321.ABB@netcom.com>
Source record: 92143
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.misc

Seems a quick and easy way to do a QRP CW transmitter would be to select one of those TTL oscillator modules that oscillate on a ham band frequency, perferrably in a CW subband. Saw some surplus "AS-IS" soundblaster PC cards with 28.322MHz, seen a few other ham freqs elsewhere too.

Mount the oscillator module at the feedpoint of a dipole or vertical, and run a +5 volt switched (by morse code key) from the ham shack. You'll need a seperate recieve antenna. Or just use a Radio Shark shortwave receiver with BFO and a long-wire antenna. It would be like the old days of the All-code novice license, with xtal locked xmit frequencies.

Yeah, it's full of harmonics, but at these QRP levels, that shouldn't much matter. But if you do RFI your neighbor during his favorite TV show, just wait untill that show is over.

>get it directly from Astron and install it yourself.

That sounds like a very good idea! The standard option, where the crowbar forces the supply into a fold-back condition, is really intended for bench use. It allows you to experiment by varying the voltage, and the crowbar prevents you from accidentally appplying too much.

The situation with repeaters and remote sites is different. There the output voltage is fixed and the crowbar is intended to protect against an overvoltage caused by a failure in the power supply itself (especially due to a mains surge). For that purpose you need a very simple trip circuit that reliably removes power from the downstream equipment and preferably disconnects the mains too. Protection must NOT reply on any kind of normal circuit operation from the power supply, because it must be assumed to have failed.

Hello,

A while back I got my first CB, a Cobra 18RV. I did not have an antenna, so I simply put up an old mini-TV Dipole antenna in my attic, I ran the wire down, and simply connected it to the antenna conector. I didn't ground the radio, I didn't even have anything leading out of the outside part of the antenna connector on my CB. I found performance to be OK, not horrible, but yet not quite good. I got up to 5 miles range. Then the mic went out on the radio. I found out that a new mic from Radio Shack is $14.95, but I paid $15 for the CB, so I thought it would be cheaper to just get a new CB. So I did. I found a brand new, in the box, Cobra 19 Ultra for sale at a flea market for $25, so I bought it. The unit was brand new. I got the whole thing together, but I already had taken down my mini-TV dipole in the attic. So now I went searching for a base CB antenna. I got one for $7 at a flea market, and I also got a SWR/Power meter too. The antenna is about 9 feet high, and came with a small mag mount base thing, which obviosly didn't belong on this antenna. I got the proper adapters from Radio Shack, and put it in the highest point in my attic. I used a cable TV wire by changing the plugs on each end to run it down. Now, when I key the radio (remember, this is the Cobra 19, not the 18RV) I see the radio's build it S-RF/Power meter go all the way max to the red part. From my expirience, this means that the antenna is performing well. My base power supply is a old train set power supply, which has a variable meter that goes from like 3 volts all the way up to about 14 volts. I run it at 14 volts, and the radio's meter seems to be showing that the power supply is fine. I also have an external SWR/Power meter, but I don't know how to use it. I didn't get the instructions with it. It's a Radio Shack Micronta meter, with a switch that switches between "ref" and "fwd", and a small whole in the middle which reads "FS ANT", and also a tuning dial that reads "CAL". I have found that my range has decreased alot, I now get about 2 miles. Could this be because I'm using a Cobra 19, and not the 18? The Cobra 18RV is almost twice as big as the 19, but the 18RV has three weather channels, and the 19 doesn't. Could it be simply because the 19 is phisicly smaller in size? The 18RV is an older model, I would guess 1990 or 1991. The 19 is brand new. Both radios perform excellent when mobile with a mag mount, I sometimes get up to 20 miles. Please help me with this installation. What am I doing wrong? Should I install the SWR meter and see what happens? I know that a 1:1 match is perfect, and if the second number is high then it's a bad antenna match. But I do not know how to work the SWR meter. I also tried adding ground. There is a small screw on the back of the 19 where you can hook up a wire to ground, and I tried it by putting the other end of the wire around a metal nail and putting it into the

lower part of an electrical outlet which is ground, but I did not see a diffrence. Please tell me what I am doing wrong. My operating location is also somewhat low, surrounded by some hills, but nothing major. Please advise me.

Thanks alot,
EugeneD@aol.com

For Sale: Tube Equipment/ Oil Caps/ Tubes

Sherwood S-3000-III FM-stereo capable Tuner
-excellent working condition; in good alignment; very sensitive;
accurate tracking
-no MPX-operating mono/ proprietary jack easily modded into universal
MPX out
-original Sherwood branded tubes
-the tuner sounds wonderfull!!
Sherwood S-1000-III mono Integrated amp
-excellent working condition
-2 x 7868-good (Bogen) included/ 2 x 6eu7 / 1 x 6k11
-has 2 mic inputs AND 4/8/16 ohm taps and 70v

Both with metal cabinets in very good cosmetic condition (few face
scratches on tuner)
$80.00 each or $150.00 for both + shipping

NOS Oil Caps

11 Westcap 1uf 400v code 2150005685 2 x lot 1522/ 6 x lot 2058/ 3 x
lot 6146
8 Sangamo 1uf 300v code cpv 09a1kd105j

$65.00 for all. I would prefer to sell all, hence discount.

Depending on the tones you want to decode, if you are decoding DTMF
tones (phone tones), you can use a Mitel MT8870. This device has the
filters inside, and outputs a 4 bit result.

Hi,

Here is the latest index of L.O.S.A. It includes almost 100 ideas
of what you can use your BASIC Stamp's for (many with code). You
can download the complete L.O.S.A from the following places...

WWW:

http://www.hth.com/losa.htm

FTP:

ftp://ftp.parallaxinc.com/pub/text/losa.txt

1.0 Whats is L.O.S.A all about ?
---

I started to compile L.O.S.A because I know there are lots of great
ideas and many problems that are solved with the BASIC Stamp and the
main purpose of this list is to get an idea of what other people are
using their BASIC Stamps for and maybe get some inspiration or hints.

1.1 How can I contribute to this list ?
---

If you have done something (big or small) with the BASIC Stamp that
you are willing to tell others please use the form given below and
write a short description, nothing fancy is needed just a simple
explanation. If you have source code to share that's even better but
it's not necessary.

Visit the following Web site and fill in the contribution form...

http://www.hth.com/losa.htm

1.2 List of contributions

2567 is a dual 567. It is normally prefixed with two letters like XR or
NE depending on the manufacturer.

I suspect that these modules output square waves, which means that it's more than "full of harmonics", it _is_ harmonics. I'm no expert, but it seems to me that the FCC regulations regarding spectral purity of amateur transmitters come into play here, even at QRP levels.

Besides, it's not generally good relations with the general public to be QRMing all across the many bands. I suspect that a simple bandpass filter on the output would solve all of that, and save you from a punch in the nose from your neighbor.

## 1508. Some advice please....

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-01 00:00:00 UTC
From: 629371@worldnet.att.net
Message-ID: <33E1DE84.2833@worldnet.att.net>
Source record: 92074

I've got a non-ham friend who's dad died a few weeks ago. In cleaning out the shack, we've managed to get rid of most of the gear, but there are boxes and boxes of misc. parts, such as packages of resistors, capacitors (sp?), coils, mini motors, roller inductor tuners, etc...that we have no idea of their value or what to do with them. Almost 6 cartons worth, and most of the stuff is new, still in their packages...

To my friend, it's junk...to me, I know all these components must be worth a couple hundred (or more) dollars, but I don't have any idea how to price them and get rid of them. There's no hamfest coming up...

Any money we get will go to his widow. We can't just throw/give them away, without explaining to the probate court why we junked good equipment/parts...I'm stuck.

Any help/advice is appreciated.

John

# 1509. Re: Info on Tone Decoders ??

: I need to build a tone decoder system. The system is based of a 2+2 System.

: The range is 600 to 1500 Hz I was thinking of using 2 NE567's.
: If anyone has a better idea please let me know. Web page reference
: welcome.

: My design seems like the best but it never hurts to get input..

Long ago and far away I worked on a DTMF (= "touch-tone") decoder using
NE567s. It turned out to be quite an education.

The problem was not the NE5676s, although there were some issues getting
the PLLs set up appropriately. Rather, the problems were with rejecting
noise inputs that included normal voice conversation.

By the time I made it work with adaquate rejection of false inputs, I
found I had to normalize the input (run it through an AGC circuit, which
has its own set of issues to do properly), then
band-split it into the DTMF high and low group frequencies, then put
schmitt-limiters between the filters and the tone-detectors (to keep
the detectors from seeing low-level inputs) and then put a timer on the
decoded output to make sure it was present for a required minimum amount
of time.

About the time I got that far, a commercial DTMF decoder became available
in IC form, and that is what we wound up using instead.

The last time I looked (8 years ago or so), a company called Teltone, located
in Belview, WA, had a competant IC available for $10 or so. All you had to
add was a color-burst crystal ($1?), power, and appropriate
input and output connections. Output was TTL levels, BCD plus strobe.

I realize that is not as much fun as rolling your own, but it seems
quicker and cheaper.

Good luck,

Joe

Actually I seem to recall a project published some time back using
such oscillators as the basis for a simple rig. I also note that using
low pass filters, it's possible to filter even the output of a square wave
oscillator, btw, I don't think these were square wave oscillators.
Some shaping in the circuitry keying the rig, and you've probably got
a rig worth trying to play with. OK, the crystal control is a pain, but
if it works, haven't you had some fun?

Now Jeremi has a sense of humor !

A single frequency transmitter with a PLL..... :-)))

and Paul probably doesn't have a clue about crystals and multipliers.
:-(

I would recommend the Amateur Radio Handbook produced by the ARRL except
he would probably end up building a PLL based transmitter.... :-&

PAUL <-- get yourself a 9.458 crystal, then build an oscillator
followed by one doubler and two tripler amplifiers. Viola! you are
transmitting on 170.244 MHZ. A simple tweak of the oscillator tuning
capicator later and you are on 170.245 - sans modulation - cept maybe
some HUMMMMM if you don't have a stable power source..... :-)

From: Murray Kelly <mkelly@powerup.com.au>
Message-ID: <33E16378.5BC2@powerup.com.au>
Source record: 92083

When these resonators first came out (?1970-ish) the two legged
devices were said to be for emitter load by-pass at 455KHz.

They narrowed up the pass-band and assisted the other tuned
circuits. The stated emiter load they were intended for was
3K3 R.

I used a few in my old FRG-7 but whether they made any difference
was hard to tell!

Cheers

Try the program APLAC from Nokia Phones & Helsinki Univ.
I forgot the primary ftp server, but it was on
nic.funet.fi (or is it now ftp.funet.fi).
It is a serious program for MSWIN or Linux. You'll
need a box of paper or so to print the documentation.

Interrest by making $50,000 ?

HERE"S A FUN WAY TO MAKE SOME EXTRA CASH!!!! WHO KNOWS YOU MAY EVEN
GET RICH!!!!!!!!!!!!!!!!!!!!!!!!!!!!You gotta be crazy! How on earth
do you think you can buy 50 grand for lousy 5 buck? Well, that's what
I was wondering, too until I came across this letter.First of all,
IT'S PERFECTLY LEGAL!(Call 1-800-725-2161) if you have any questions
about the following opportunity to make $50,000.00 and that probably
WITHIN LESS THAN TWO MONTHS!Well, here it goes:A little while back, I
was browsing these newsgroups, just like you are now, and came across
an article similar to this that said you could make thousands of
dollars within weeks with only an
initial investment of $5.00! So I thought, "yeah, right, this must be
a
joke," but like most of us I was curious, so I kept reading. Anyway,
it said
that you $1.00 toeach ofthe 5 names and addresses stated in the
article.
You then place your own name and address in the bottom of the list at
#5, and
post the article in at least 200 newsgroups. (There are thousands) No
catch,
that was it.I knew that that was the opportunity I had waited for a
long
time.I thought it was about time that the money of the world gets into
the right hands! OURS, right? I never had a doubt that this thing
will
actually work and even if it didn't, what were 5 stamps and $5.00 for
a
try? As I mention before, like most of us I was a little skeptical and
a little worried about the legal aspects of it all. So I checked it
out
with the US Post Office (1-800-725-2161) and they confirmed that it is
indeed
legal! Now, that's how your story WILL sound like, too if you
participate:Well GUESS WHAT!!... within 7 days, I started getting
money in
the mail! Iwas shocked! I still figure it would end soon, and didn't
```

give
it another thought. But the money kept coming in. In my first week,
I
made about $20.00 to $30.00 dollars. By the end of the second week I
had
made a totalof over $1,000.00!!!!! In the third week I had over
$10,000.00
and it's still growing. This is now my fourth week and I have made a
total
of just $42,000.00 and it's still coming in....Let me tell you how
this works
and most importantly, why it works...also,make sure you print a copy
of this
article NOW, so you can get the information off of it as you need it.
The
process is very simple and consist of 3 easy steps:STEP1: Get 5
separate
pieces of paper and write the following on each piece of paper "PLEASE
PUT ME
ON YOUR MAILING LIST." Now get 5 $1.00 bills and place ONE inside each
of the 5 pieces of paper so the bill will not be seen through the
envelope to
prevent thievery. Next, place one paper ineach ofthe 5 envelopes and
seal
them. You should now have 5 sealed envelopes,each with a piece of
paper
stating the above phrase and a $1.00 bill.What you are doing is
creating a
service by this. This is perfectly legal! Mail the 5 envelopes to the
following addresses:

#1 J. A. Gang
970 Paces Circle #300
Apopka, FL
32703

#2 T.J. Kashin
2009 Hollyhock St
Pekin, IL 61554

#3 Fred Dufour
1596 39avenue
Montreal, QC
H1A4A2, Canada

#4 Robert Wisowaty
1341 Kane st.
La Crosse, WI 54603

#5 Adrian Silva
Tepozteco 102A
Cuernavaca MOR 62150

Mexico

STEP 2: Now take the #1 name off the list that you see above, move the other names up(2 becomes 1, 3 becomes 2, ect...) and YOUR NAME as number 5 on the list.STEP 3: Change anything you need to but try to keep this article as close to the original as possible.
Now, post your article to at least 200 newsgroups. (I think there is close to 18,000 groups) All you need is 200, but remember, the more you
post, the more money you make!Don't know HOW to post in the newsgroups?
Well do exactly the following:**REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!!BUT YOU HAVE TO POST A MINIMUM OF 200****If these instructions are too complex to follow, try Forte's "Free Agent." It is freeware for non-commercial use.To download it, simply use a search utility and type "Forte Free Agent". You should be able to find it.**That's it! You will begin receiving money from around the world within days! You may eventully want to rent a P.O. box due to the large amount of mail you receive. If you wish to say anonymous,you can invent a name to use as long
as the postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.**Now the Why part:This entire principle works because it is in a
format of an upside down tree with thousands of branches. Everyone below you
will see to it that the tree continues because they want to get money. Those
below THEM will continue because THEY want to get the cash ect.Out of 200
postings, say I receive only 5 replies ( a very low example). So then I made
$5.00 with my name at #5 on the letter. Now, each ofthe 5 persons who just
sent me $1.00 make the minimum 200 postings, each with myname at #4 and only
5 persons responds to each of the original 5, that is another $25.00 for me,
now those 25 each make 200 minimum post with myname at #3 and only 5 reply each, I will bring in an additional $125.00!Now,those 125 persons
turn around and post the minimun 200 with my name at#2 and only 5 replies
each, I will make an additional $626.00! Ok, now here is the fun part, each
of the 625 persons post a minimum of 200 letters with my name at #1 and they
each receive 5 replies, that just made me $3,125.00!!! With a original
investment of only $5.00! AMAZING! And as I said 5 resonses is actually VERY

LOW! Average is probable 20 to 30! So lets put those figures at just 15
responses per person. Here is what you will make:at #5 $15.00 at #4 $225.00 at
#3 $3,375.00 at #2 $50,625.00 at #1 $759,375.00. When your name is no longer on
the list, you just take the latest posting in the newsgroups, and send out
another $5.00 to the names on the list, putting your name at number 5 and
start posting again. The thing to remember is that thousands of people all
over the world are joining the internet and reading these articles everyday,
JUST LIKE YOU are now!!And this will go on and on and on...get the picture?
Well, there's 5,000,000,000 people in the world and most of them will
eventully end up being hooked into the internet. So there are virtually
unlimited resources. Of course this will work the best at the very
beginning so the faster you post, the better for YOU!So can you afford $5.00
and see if it really works?? I think so! People have said, "what if the plan
is played out and no one sends you the money? So what! What are the chances
of that happening when there are tons of newusers and new honest works?? I
think so... People have said, "what if the plan is played out and no one
sends you the money? So what! What are the chances of that happening when
there are tons of new honest users and new honest people who are joining the
internet and newsgroups everyday and are willing to give it a try? Estimates
are at 20,000 to 30,000 new users everyday, with thousands of those joining
the actual internet. remember, play FAIRLY and HONESTLY and this will work.
You just have to be honest.Make sure you print this article out RIGHT NOW,
also. Try to keep a list of everyone that you sends you money and always
keep an eye on the news groups to make sure everyone is playing fairly.Remember
, HONESTY IS THE BEST POLICY. You don't need to cheat the basic idea
to make the money!!GOOD LUCK to all and pleas play fairly and reap the
huge rewards from this,which is tons of extra CASH. **By the way, if you try to

deceive people by posting the messages with your name in the list and not
sending the money to the rest of the people already on the list, you will not
get as much. Someone I talked to knew someone who did that and he only made
about $150.00, and that's after seven or eight weeks! Then he sent the 5
$1.00 bills, people added him to their list, and inn 4-5 weeks he had over
$10k. This is the fairest and most honest way I have ever seen to share the
wealth of the world without costing anything but our time!!! You also may
want to buy mailing ande-mail list for future dollars.Please remember to
declare your extra income. Thanks once again......

# 1525. New ham seeks setup examples

Newsgroup: rec.radio.amateur.homebrew

From KC0BMC
I need to see radio setups of actual systems to get
an idea of how the hardware is interconnected. My primary
interest is 2-meter/70cm homebase with a TNC packet
interface to a computer. Also, how to lightning protect an
antenna. I've surfed the internet for hours for this info
preferably in picture/drawing form, but came up empty handed.
Presently I've got a the following on loan: 0.5 watt Kenwood 2 meter HT,
a Kantronics KPC-3, a small "brick" RF inline amplifier, and
an old Drake receiver. I have plans to make a 2 meter
antenna.
thanks in advance, Mike

Hello fellow hams,

I am interested in finding a way to make my kenwood tm251-a (9600 baud) radio and my aea pk96 tnc into a home brew personal paging system.

I am looking for some hams currently doing this, or who know were to point me in the direction so I can locate software and any additonal hardware to make this happen.

Also if anyone knows which part of 97 fcc rules that pertain to using a tnc to paging and any addtional regulations that come with this mode of operation your help would be most appriciated.

Thank you!!!!!
Cliff

"UHF unterlage V" is now a quite old book. Mine is dated 1989 (zweite
Auflage). I believe you will find better designs in English
publications.
We particularly like the English Butler oscillator circuits, everybody
I can think of in Scandinavia now use them, but we don't like the SMD
versions.
We have now only two designs to choose between:
The English circuits, and
LA6LCA circuits

Hello Jean-Pierre
If you want a good and cheap 2 meter antenna, try a dipole.
run coax to a high place and solder 19" of wire to the center
conductor and another 19" of wire to the braid. and hang it so
that it is in a vertical orientation. a piece of fishing line
or nylon string will hold it up fine. good luck and see you on the
air soon i hope. 73 de hal.. w4pmj

Jean-Pierre,

A j-pole might be lossy or lousy (depending on your view), but they potentially could be all you need. If you want to be hitting local repeaters, you could use most anything (even the rubber-duck from a handheld!). Actually, i find my j-pole to be quite good. I work 3 different repeaters > 20 miles away, and 3 different packet nodes 25+ miles away, and my jpole is up only 20-25 feet (at least one of those packet stations also has a jpole on their roof, not tower). BTW-This is Iowa, so the terrain is rolling, definately not mountainous.

Aother good point about the j-pole is its relative ease of mounting (or dangling from a tree limb as in my case). You may find that location of the antenna may be more important than which antenna for a particular QTH/Repeater need. Hey, you're going to be a ham, experiment! Build your jpole (its cheap), and use it. Later on build (or buy) another type of antenna, and see which one works better for your uses. You could always use one as a transportable to drag with you to an away operating site (a 300-twin lead j-pole that rolls up is good for this, as is the rugged copper-pipe jpole). You may also find that in the near future you may want a packet station also, then you will want to have 2 antennae anyway.

Good luck in getting your ham ticket. Let us know how it all goes.

cliff,
ive done what you want to do. i dont know if the pk96 will do
amateur paging. i dont believe so. to do the amateur paging, your
tnc must have the paging command set, and kantronics is the only
manufacturer that i know of that has this option. and at this time i
believe its only in the kantronics kpc-96/12 as you must use only
the 9600 baud port. (rules out the kpc-3)
you may have to trade your pk-96 for a kantronics kpc-96/12
tnc. for more info check out www.kantronics.com
but basically here is what i did. i saw the kantronics demo
booth at dayton in 1996 and they had amateur paging set up using 2
meters. i was intrigued with the idea because i have a deaf daughter
and i thought this might be a good idea for just having a way of
calling her or sending messages to her by using the vibration mode of
the pager.... so heres what i did....i got a hold of an motorola
alpha-numeric pager..then i found a paging dealer who would trade me
the 900 meg board already installed in the pager for a commercial 150
mhz (vhf) board. then i sent to kantronics for the 144.090 xtal (about
20 bucks shipped) and had the paging guy install the xtal and tune up
and tweak the pager. you can find him, and maybe even a pager, by
checking out the newsgroup tnn.comm.pager his name is brian skube

and his business is located in lake elsinore, california.
for software i simply used the kantronics pacterm program.
although procomm or any terminal program will do. getting the system
to work flawlessly with no paging errors requires setting up the radio
and tnc with a service monitor and setting the deviation properly.
that is basically all there is to it.

The RS wireless mike kit can be modified to transmit on 170.245.
Instructions on how to do this can be found in the book NOW HEAR THIS
by Winston Arrington and CRB use to carry it. The schematics Mr.
Arrinton discusses in detail are the same basic circuit of the RS kit.
BTW - The book gives schematics to modify a xmitter from 30-300mhz.

Hi Eric and all

I have repaired a couple of HP1715A scopes (I think its the 200 MHz version of the family). The crimp connections of the connectors to the various circuit boards were done miserably on both scopes. The wire was loose in the crimp. I went in and soldered each crimp. The scopes work well once this was done. They seem to be available working for about $400 (about half that of the equivalent Tek scope). I paid $50 for mine when it had no sweep but bright spot on CRT. They are nice scopes when they work. ha.

Subject: [CW] NAVY-MARINE CORPS MARS CW IS BACK!!!!
Date sent: Sun, 27 Jul 1997 01:09:12 -0500

HELLO AND THANKS FOR READING

TONIGHT WAS A NIGHT WORTH WAITING FOR.

IN A RECENT CHIEF NAVY-MARINE CORPS BROADCAST, THE CHIEF NAVY-MARINE
CORPS
MARS ANNOUNCED THAT DOD HAS AUTHORIZED CW NETS AGAIN. IN SHORT ORDER,
WE
HAVE FOUR NETS WORKING AGAIN IN LA. WHILE I CAN NOT GIVE OUT THE
EXACT
DETAILS, THOSE IN SOUTH CENTRAL STATES WILL HEAR ONE AT 2100 CDT JUST
A FEW
KHZ ABOVE THE 80M HAM BAND. AFTER A WEEK OUT OF TOWN, IT WAS VERY
NICE TO
HEAR A MESSAGE PASSED BY CW FROM AN ANOTHER MARS STATION TO A
NAVY-MARINE
CORPS STATION FOR RELAY ON THE DIGITAL NETWORK.

NO I AM NOT JUST HUNG UP ON CW FOR THE H__L OF IT. I WAS NECOS OF A
NAVY-MARINE CORPS VOICE (SSB) NET EARLIER THIS EVENING AND COULD NOT
HEAR MANY OF THE STATIONS ON THE NET. WITH SIMILAR CONDITIONS (LOCAL
THUNDERSTORMS) I WAS ABLE TO COPY A MULTI ADR MESSAGE SENT THREE HOURS
LATER VIA CW. IT IS REALLY TRUE THAT CW CAN GET THROUGH BETTER THAN
SSB.

YES I KNOW THAT NOT ALL HAMS CAN READ CW THROUGH THE NOISE, BUT THOSE
WHO CAN FIND IT EASIER THAN SSB. WE HAD THE MESSAGES PASSED WITH SOME
CHAT
TIME AFTER THE NET. I HAVE SEEN VOICE NETS TAKE LONGER TO HANDLE LESS
TRAFFIC. MAYBE THE WISDOM OF USING A SYSTEM THAT WORKS MAKES SENSE
AFTER
ALL.

CW WAS NEVER DEAD AT K5KV AND IS REVIVED AT NNN0LGN.

73

BENNY

altavoz: Congrats on passing the test ( premature ) .
Ham radio swap meet , buy Ringo Ranger II ( $35 ) . It has the
highest gain of any $35 ant . Don't tilt it , you lose gain .
Then build a J pole and compare ( snicker snicker) .
Everyone talks about matching to 50 ohm coax , no one talks
gain pattern . J pole is bad pattern.

I'm new to this ham stuff. I don't even have my license yet. All I do presently is listen to the local repeaters with my portable and study to pass my exam in september.

I need a vertical antenna from which I can get good performance. I know that quads or yagis offer a lot of gain but I have no rotor and I don't plan on getting one in the near future.

Now, according to the latest posts in the various ham NG, a J-pole is a lousy antenna. I had planned to build one sometimes this month. Now I'm not just sure I should. I heard about dipoles doing a better job. Is this true and where, on the Internet, can I get plans to do this ? Is there other omnidirectionnal antennas that can be built on a thight budget ?

Greetings:

Please accept this invitation to visit our Web Sites. Both are
constantly growing, and that is where
you come in. We need your input.

The first, http://www.kb8uyz.com/kb8tnq is the KB8TNQ Ultimate Amateur

Radio Page! and is
a great source for the Ham and even those interested in getting into the

hobby. With a plethora of
links and a "Site O' the Week"...(one selected by yours truly)
we hope you'll find this Site user friendly.

The second, found at http://www.kb8uyz.com/cmarc is the Central
Michigan Amateur Radio
Club Web Site. While this Site is primarily a "Club" Site, we do have a

"Trader's Page", which was
recently started. All postings to this page are FREE, so if you have
unwanted Ham gear, feel free to
check it out and help us get the word out.

Thanks for your time and we'll look forward to seeing you soon.

7-3,
Jim KB8TNQ

Interesting, Im not sure who said a J pole was a lousy antenna, I guess if they were comparing it to a 10 element yagi and the comparison was gain and directivity perhaps a J pole could be considered lousy. You can make a ground plane in 15 minutes. Buy a female coax connector and solder four 20" wires to the flat base portion sticking straight our or bent down slightly, then solder one vertical 19.5" wire to the center. Voila, a 2m ground plane.

I dont have my antenna book handy but I belive a J pole has a small amount of gain over a 1/4 wave ground plane as described above. I used a J pole for many contacts to the RS-10 satellite, didn't seem to lousy to me. Your not going to see much difference if your monitoring local repeater activity. Jean, I strongly suggest you buy the ARRL antenna book, (a good investment in your ham education) after reading it a few times you'll see there is not much magic in antennas and you can build them out of just about anything.

Good luck, Tim, ka8ddz

# 1544. Re: QRP CW xmitter: Use a TTL oscillator module on a ham band

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-03 00:00:00 UTC
From: Michael Black <blackm00@CAM.ORG>
Message-ID: <Pine.GSO.3.94.970803013108.652A-100000@Stratus.CAM.ORG>
Source record: 92011

There might have been articles in other places, but I know there was an article in 73 about using one of those TTL oscillators. I wish I could remember the issue; if I recall correctly, there were some other QRP articles in the same issue.

If the oscillators are TTL, then they have to be square wave out. Otherwise, the TTL that they feed would require some sort of interface circuit to turn the signal into TTL.

I can't recall what kind of filtering the article used, but that might be because there was none. I think this was meant as a QQRP rig, and the author used a pot in series with the 5volt line to reduce power. That might explain something; if the voltage went low enough, the oscillator may be putting out less of a square wave.

But there have been other articles using TTL in transmitters, so there are circuits out there that could be copied. I remember one article in Ham Radio about 1975 or so, and it showed how to build an SSB transmitter out of TTL. It was sort of cheating, since the author linearized the gates to handle the actual signals. He didn't even bother using a balanced modulator, instead depended on the crystal filter to take out the carrier.

From the articles I've seen, a common scheme is to have an oscillator based on some TTL gates, and feeding something like a 74244 (did I get the number right? I'm thinking of an 8-bit buffer), with all the sections in parallel. Some of the articles have even added a simple direct conversion receiver.

I agree with the comment about harmonics. I admit I haven't checked the regulations in a long time, but I thought they did not specify certain levels, but how much reduced the harmonics are. If so, the harmonic suppresion has to be as good on a QRP transmitter as on a full legal limit rig.

The idea of putting the transmitter right at the antenna does create possibilities. I remember seeing old Electronic Illustrated articles describing "DX" transmitters for unlicensed use on the CB band. You'd build a 100mW input transmitter, place it right at the antenna (which was restriced in size by law), avoiding feedline losses. You'd put up as big a receiving antenna as you could afford or have space for. The same idea is done down at the 180KHz license free band, according to articles I've seen. There are a lot of effective small receiving antennas nowadays, so the idea of using separate antennas is a possibility.

One thing I've thought of, after looking over loop antennas for transmitting, was the idea of building a tube transmitter where the tuned circuit in the plate was the loop antenna. You'd have to put the transmitter at the antenna, and devise some method of remotely tuning it (something already being done with transmitting loops). No feedline loss. Sadly, I can't remember right now why I thought there was a good reason for trying this, but I had one when I thought of it.

The FIRE-BALL QRP Rig 50 milliwatts of pure power by Bill Brown WB8ELK
appeared in 73 November, 1990 pg. 18,21. Doing a quick scan of the
article nothing is mentioned about filtering.

# 1549. PL259 Attachment to COAX Cable

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-03 00:00:00 UTC
From: niel brieger <nbrieger@ix.netcom.com>
Message-ID: <33E49414.6D4C@ix.netcom.com>
Source record: 92016

I'm wondering what the best way to attach a PL259 to a coax cable is. I was told a soldering gun, but I'm having the darndest time getting this weller 140 watt soldering gun to heat the PL259 up enough to melt solder inside. It has a duty cycle of 20%, use it for 1 minute, let it cool for 4. If you try to go a bit past the 1 minute, the gun actually seems to start to cool on its own, because the tip gets "stuck" in the solder joint. On field day, we used a 100 watt weller soldering iron to attach some PL259's to cables with no problem whatsoever. So I'm wondering if I should be looking to purchase one of those.

Any tips or hints or what works best for you would be appreciated!

73,
Niel Brieger, KC5ZJR

ANTENNA RAISING INCIDENT

"I'm writing in response to your request for additional information for Block Number 3 of the Accident Reporting Form. I put "Poor Planning" as the cause of my accident. You said in your letter I should explain more fully, and I trust the following details will be sufficient."
"I am an amateur radio operator and on the day of the accident I was working alone on the top section of my 80 foot tower. When I had completed my work, I discovered that I had, over the course of several trips up the tower, brought up about 300 pounds of tools and hardware. Rather than carry the now un-needed tools and materials down by hand, I decided to lower the items down in a small barrel by using a pulley, which fortunately was attached to the gin pole at the top of the tower."
"Securing the rope at ground level, I went to the top of the tower and loaded the tools and materials into the barrel. I went back to the ground and untied the rope, holding it tightly to insure a slow descent of the 300 lbs. of tools. You will note in Block Number 11 of the Accident Reporting Form, that I weigh only 155 pounds."
"Due to my surprise at being jerked off the ground so suddenly, I lost my presence of mind and forgot to let go of the rope. Needless to say, I proceeded at a rather rapid rate of speed up the side of the tower. In the vicinity of the 40 foot level, I met the barrel coming down....this explains my fractured skull and broken collarbone. Slowed only slightly, I continued my rapid ascent, not stopping until the fingers of my right hand were two knuckles deep into the pulley."
"Fortunately, by this time, I had regained my presence of mind and was able to hold onto the rope in spite of the pain. At approximately the same time, however, the barrel of tools hit the ground and the bottom fell out of the barrel. Devoid of the weight of the tools, the barrel now weighed approximately 20 lbs." " I refer you again to my weight in Block 11. As you might imagine, I began a rapid descent down the side of the tower. In the vicinity of the 40 ft. level, I met the barrel coming up...this accounts for the two fractured ankles and the lacerations on my legs and lower body."
"The encounter with the barrel slowed me enough to lessen my injuries when I fell on to the pile of tools, and fortunately, only 3 vertebras were cracked. I'm sorry to report, however, that as I lay there on the tools in pain, unable to stand, and

watching the emply barrel 80 feet above me, I again lost my
presence of mind. I let go of the rope."

# 1551. Re: PL259 Attachment to COAX Cable

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-03 00:00:00 UTC
From: nospam@worldnet.att.net
Message-ID: <33e4b01b.1439584@netnews.worldnet.att.net>
Source record: 92018

I have attached many PL259's to coax over the years and this is the process I have developed. First you need a proper soldering iron, a soldering gun won't work. (as you found out). The iron should be 100 to 150 watt with a large tip that will retain a lot of heat. I usually use a solder tip adapter attached to a hand held propane tank. This may sound like an overkill, but you want to get a lot of heat to the shell quickly so that you can apply the solder and remove the heat before the insulation cooks. Trim the outer coax insulation back a inch or so and tin the braid, then sweat (cool) the braid with a damp sponge or rag. Use a tubing cutter to cut the braid to length, then strip off the inner insulation to the proper length and tin the center conductor. Slip the connector shell on the cable and install the connector so that the braid is visable at the connector holes.
Using your hot, well tinned soldering iron, flow solder into the holes and sweat the connector as soon as possable trying to avoid damage to the coax.
Whenever you solder be sure that the metal is clean and free of grease or oil. Soldering is alloying of lead/tin to a base metal. If that base metal is not exposed, solder can't alloy to it and the result will be a poor joint. Heat for soldering is transfered via the solder on a well tinned iron. When you have the proper heat touch the solder to the iron / metal junction and the solder should flow and "wet" the metal without balling up and running off.
After the connector is totally cool I use flux remover to clean off any flux residues that may absorb moisture and corrode in the future.
Happy Soldering,
Buzz

Anyone tried using these devices to isolate VFOs from their loads? I saw a circuit in a professional radio/elecronics mag in the 1970 using one up to about 1 MHz. Surely this is easy-peasy now...up into the 10s or 100s of MHz? These devices don't seem to have listed their maximum operating freqs. Any ideas?
Thanks

Hi Neil
Before you go and buy another iron make sure the the nuts that hold the soldering gun tips are tight and real!! tight. Any resistance at this point will develop heat at the connections and not at the tip. After you do that it will still won't be real easy. I have used the gun but prefer a Weller temp controlled iron.

# 1558. [Q] Yaesu FT-290RII as IF (Mods needed?)

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-03 00:00:00 UTC
From: boomerjp@mailhost.ecn.uoknor.edu
Message-ID: <5s341j$ihc$1@artemis.backbone.ou.edu>
Source record: 92025

I plan on using my Yaesu FT-290RII as a 2m IF for a couple of trans-
verters. Now, the minimum power out is 2.5W from the radio, while
the transverters I'm looking at use 1mW drive (0 dBm).

According to my calculation, 20 log (1m/2.5) = -68 dB.

So, do I need a couple of attenuators in series (to reduce
loses and ringing) of 20, 20, 20, 8 dB respectively, or will
the transmitter choke on the attenuation?

My calculations for the attenuators are:
Pi attenuator: R1, R3 R2
8 dB 116.14 52.84
20 dB 61.11 247.5

The attenuator will be placed after the IF switch, so the receive
line won't be coming through it, of course!

Is there an easier (and better) way of knocking down the IF drive?
Maybe mod the radio for the low power setting? (Last resort)

BTW, the band is 902MHz. 1.2GHz will be later, and the Ten-tec 6m
transverter won't need this consideration.

Thanks!
John

I have built the TenTec 6M FM Tranceiver, and have had very good luck with it. If you have a VOM, and basic construction tools (ie. soldering iron,screwdrivers, small diagonal cutters), you should have no problem building and aligning the tranceiver. I have also built the TenTec HF/VHF SWR/Watt meter. With this unit, it helps to have both HF and VHF transmiters with known output ratings for the adjustments.

Source record: 92027

I've got an old freq counter I have used for years. I would appear that the 'brains' of the counter have failed. Everything else on the board is glue logic.

Anyone know of a replacement? The chip data is below, anyone recognize it.

Newbie builder wants to know:

In regards to the W1FB Universal DC reciever, of course there are several coil, cap combos for the tuned input, each to tune a different band. Typically using 100pf or so to tweak it in.

My question is, why not use one coil in the middle of the road and then a ganged 365pf cap to tune? I seemed to have success with this on 40/80 and even 160 when I lumped in another fixed cap. For someone wanting a multiband Rx this seemed to make the most sense.

Am I missing something? Do I loose somthing by doing this?

Tim, ka8ddz

>Is the tower to be self supporting or guyed?

As one who in the dim and distant past built *much* bigger (450+ ft.)
steel structures may I comment?

Firstly a tower is self-supporting, a mast is guyed.

Secondly, you don't always need a gin pole for a mast. What was done was
to 'float' a relatively small pole (the stick) in the middle of the main
structure (remember the Skylon, Festival of Britain, 1951?). The stick
was supported by ropes from the tops of the (usually four) legs of the
main mast as-high-as-they-were to the base of the stick and the stick
was then guyed (four ropes) to the ground at its top. A block on the top
of the stick was then used to hoist and fit further leg-members to the
main mast. This required the four guys to the top of the stick being
winched in and out to tilt it. When the new main mast leg-members were
in place (plus any cross-bracings), the stick was then hoisted higher so
as to be supported again at its base by ropes from the now higher four
main mast legs - the guys at the top of the stick had to be loosened at
the same time.

It really requires at the least four (preferably more) winches, perhaps
eight people and, if I may say so, a lot of skill. Not really suitable
for an amateur project!

Regards,

You need about 33 dB of attenuation as you summised. Most microwave
transverters have to much receive gain. I suggest you put a 10 dB pad
in front of both receive and transmit to prevent you blowing up
the mixer in the event of a swiching failure - like forgetting to
PTT line.

There is a PCB sold by the UK microwave components service that does
what you want, including the switching and a 28V supply for the
microwave RF changover relay. This is designed for the FT290/IC202.

As you have an FT290II, you will find no switching voltage on the
connector. It is simple to add an RF choke from the +V TX line and
an isolation capacitor. It does not adversely affect the rig.

Don't try and use the low power setting.

Of course, if you just want to use the 290 for transverter driving,
you can bypass the final transmit amplifier and suffer a longer
battery life.

Date: 1997-08-04 00:00:00 UTC
From: N.S.Birchall@lboro.ac.uk
Message-ID: <N.S.Birchall-0408971321120001@mac-cdnsb.lut.ac.uk>
Source record: 92032

can anyone help ?

I've recently picked up an Eddystone EC10 receiver, (transistor model circa 1966) at a jumble sale.

Problem is - it's not very well. Could anybody let me know where I might find a circuit diagram / manual (or copies) for this receiver.

any help much appreciated

Steve

This is not a good way to erect a tower more than 40 feet tall.
You *do not* want to tilt erect a tower that tall. The bending
moment on the tower will be *huge* and you'll likely bend the
tower if you don't break it. You want to stack the sections in place.
This only requires a 15 foot gin pole which is moved up section by
section as you hoist and install each section, IE the gin pole is
clamped to the standing section and used to hoist up the next
section. This method can be used to erect an arbitrarily tall tower.
It is the way a 1000 foot TV tower is erected, for example, and
is the way I erected my little bitty 70 foot tower.

Actually, this is GOOD. When the tip sticks to the joint, the temp is
*JUST* getting high enough to start making good solder joints. KEEP
HEATING. Don't stop! Eventually you will get the whole thing hot enough
to melt the solder properly. The reason the tip sticks is that once the
solder starts to become partially liquid, you get a better thermal
conduction path between the tip and the connector, and this "sucks" heat
out of the tip faster. Like I said, KEEP HEATING. The connector is
getting close to the right temperature.

Also, cheap-sh** PL259's like the ones Radio Shack sells seem to be plated with nickel or chrome, a material that does not take solder easily. The local HRO has a bin-full of PL259's that are made of a more silvery, satiny-looking material (they claim they're silver-plated) that are much much easier to solder than the chrome-looking ones. These units are also considerably lighter-weight than their Radio Shack counterparts (and thus would take less heat to raise to soldering temp).

The Radio Shack 259's were so crappy, they weren't even the right inner diameter to accept RG8 cable.

BTW every ARRL Handbook since time immemorial has a page or two of instructions for this.

Build a 1/4 wave with a SO239 and 8 feet of copper wire. Not very weatherproof (mine is inside, so I skipped the silicone seal it would take to weatherproof it). Mine cost $4.32. SWR 1.1:1.

Dimensions in many ARRL handbooks and other antenna books.

I tin the braid after stripping the outside insulation off an before it
gets mangled. Then cut the braid to length using a small pipe
cutter.Drilling through the solder holes to expose the brass underneath
helps. Tin the solder holes befoe putting in the cable is good too.
Drilled the threads for RG 58 adapters out to install some double braided
coax.

Hi Paul,
I've not seen the QEX article but had you considered the 1KW kits advertised in QST by Lee Martin in Myrtle Beach, SC?
I've recently completed this 8 X 2SC2879 units and it works just fine, bangs the Bird slug hard on the end stop!

It's a Plessey (GEC-Plessey Semiconductors, now) device. I've got the
data in the '94 GPS Professional Products Handbook: it's a 575 MHz
1/10/11 ECL dual-modulus divider. Try a GPS distributor.

Circuits on packet

Hi all, Ron (G0TLA) has spent a couple of weeks here
in Sweden fixing up my own QRP PMS (Personal Messaging
system) on the packet radio. My site is a mirror of
Rons PMS from which you can download loads of circuits
for antennas, transmitters, receivers, etc. The packet
address of the two PMSs are:

G0TLA @ GB7NND.#23.GBR.EU
SM0VPO @ SL0ZS.KISTA.AB.SWE.EU

Again; NO fees, memberships, registration or any other
impediment is required. All files can be automatically
by ANY licenced radio amateur.

To access, send the following packet message:

---
To request DIR of files or directories

Command: SP REQDIR@G0TLA.GB7NND.#23.GBR.EU
Title : QRP @ [insert your own bbs here]
Message: /EX (or Ctrl+Z)

or

Command: QRP REQDIR@SM0VPO.SL0ZS.KISTA.AB.SWE.EU
Title : QRP @ [insert your own bbs here]
Message: /EX (or Ctrl+Z)

---
To request file (example QRP/ANTENNA/70CMJIM.GIF)

Command: SP 7PSERVE@G0TLA.GB7NND.#23.GBR.EU
Title : QRP/ANTENNA/70CMJIM.GIF @ [insert your own bbs here]
Message: /EX (or Ctrl+Z)

or

Command: SP 7PSERVE@SM0VPO.SL0ZS.KISTA.AB.SWE.EU
Title : QRP/ANTENNA/70CMJIM.GIF @ [insert your own bbs here]
Message: /EX (or Ctrl+Z)

---

You can also find loads of files and even pictures of
finished projects at:

http://user.tninet.se/~acz732k/

I have built 10-15 beacons for 2m. 70, 23, 13cm using callsign
generator based on 1/4 SGS TTL type EPROM 93427 and two CMOS ICs,
transmitted data like: LA3UHF LA3UHF LA3UHF in DS78F . Supply 12V 90mA
We are now planning a new programmable callsign logic, a prototype has
been built transmitting: LA3SHF LA3SHF LA3SHF in JO48AE, some more
mose text is possible
It would be interesting to know if it is some interest for some scale
of producing callsign logics? Power supply is 12V 5mA

# 1582. Shortwave RX Antenna

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-04 00:00:00 UTC
From: Jason <kb5urq@earthlink.net>
Message-ID: <33E6A0F3.F2@earthlink.net>
Source record: 92048
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.antenna

Being an employee at Radio Shack, I have the DX-390 shortwave receiver (20-214). I've listened to amateurs on all the bands (on SSB of course). I got good results with my telescoping antenna which comes with the unit. I also tried the portable shortwave antenna which cips over the included rod antenna. It is 23 feet long and gives noticeable improved reception.

I noticed that my 160 meter band was completely DEAD. Not having an HF rig of my own, I thought that maybe the band was dead. I took a chance and bought the antenna kit (#278-758). It comes with 70 feet multi-stranded copper wire for the outside antenna, and about 50 feet of insulated copper wire. It comes with ceramic insulators for neat installations and some nifty plastic "thingies" for holding the antenna in place in mid air.

After waiting a few weeks and getting rope (which was NOT included), I began construction. All went fairly well and I have the copper wire about 20 feet up in the air.

After putting on my "mono" 1/8" jack onto the feed line, I plugged her in. I was extremely surprised to see and hear a vast imrprovement on everything from my amateur band coverage to regular FM broadcast bands.

I found that after all there WERE people on 160 meters.

Some bad things about it was the poor quality of the feedline, which was tiny and must have had great loss in signal (although I honestly believe that for a shortwave receiver such as mine, the amount of signal that I'm loosing probably isn't hurting me all that much).

I would love to hear from others that have used this antenna and anyy suggestions for antennas like it or similar.

I agree with KF6IIU suggesting you try a 2-meter ground plane built from wire and a SO-239 connector. I use many homemade ground planes from 108 to 700 mHz with good results.

At my workplace, (a TV studio) we've compared homebuilt vertical dipoles with homebuilt ground plane antennas, and the ground planes all seemed to work better. I'm sure our construction methods for the vertical dipoles were at fault. The ground planes were easier to build and install, so that's what we used.

If you wish to buy a groundplane kit, try the Antenna Specialists ASP-7A for 108-512 mHz. You cut the elements to length according to a chart supplied with the antenna. It works well. Price about $30 US.

For extra gain, try a 5/8 wave vertical. This has about 3 db gain over a groundplane. Length is about 45 inches at 146 mHz. This antenna has a coil and capacitor matching network in the base, and it's more difficult to build. If you want to buy one, MFJ makes a very low-cost 5/8 wave base station antenna. Lots of other companies make them, too.

I like the 5/8 wave antenna, and use one on my car with good results. If you listen to a particular repeater that's just a little noisy, the extra gain from a 5/8 wave antenna might be enough to make it full quieting.

There is a lot of loss in coax cable at 2 meters. RG-58 cable will waste a lot of signal, and should only be used for very short runs (a few meters). RG-8X is better than RG-58, and RG-8 works better still.

Good luck and welcome to ham radio!

Aren't there regulations about spurious emissions? I use these
things as marker generators. Up to L band. To hook one to an antenna
without a filter is simply irresponsible...

>:reference material.
>:

Well, it's a little more complicated than that, but basically, the value
of the capacitor between crystals in a ladder filter, determines the
bandwidth of the filter. Values like 80-100 pF wind up yielding low loss
2-3 KHz filters. Values like 300-500 pF yield rather hi loss narrow CW
filters. (For the same Q in the crystals)
I certainly would not call a Cohn filter as good as a Chebychev, but the
differences between Cohn, Cheby's, Butterworths and even equi phase
filters is only a matter of values. The topology remains the same.. A good
linear phase filter won't ring, even if it's 100 Hz wide.
Hayward has a pair of programs bundled with his book. (L.EXE and X.EXE)
that calculates those capacitor values for whatever kind of filter you
want to build.

>explain the purpose and how the value is calculated. I can not find any
>reference material.

Here are some ladder filter design formulae that were published in Pat Hawker's column in RadCom many years ago (I think that they originally came from a French amateur radio publication):

```
---X-----X---
C0 C1 C0
------------
```

C0 = 1, C1 = 2

```
---X---X---X---
C0 C1 C1 C0
---------------
```

C0 = 0.707, C1 = 2.121

```
---X---X---X---X---
C0 C1 C2 C1 C0
-------------------
```

C0 = 0.0.4142, C1 = 1.82, C2 = 2.828

For SSB X should be between 8 and 10 MHz (filter impedance = 800R - 1K)

To calculate the caps., multiply the coefficients by 1/(2*PI*f*R) where f is the xtal freq. in Hz and R is the input/output impedance in ohms.

These filters *must* be properly terminated.

At lower xtal freqs. use higher impedances for sufficient bandwidth. For CW use lower impedances and/or lower freq. xtals.

I've built a couple of SSB Rx filters using these formulae, they worked quite well. I'd use 4 xtals for the main filter, with a 2 xtal filter after the IF amp, to cut down the broadband noise.

>is the way I erected my little bitty 70 foot tower.

Having seen people get killed trying to save time, I would suggest stacking ONE section at a time if possible. Our tower riggers used to pick up steel self-supporting towers in the 120 ft range with a crane, but the idea stopped after a 100 ft plus boom monster crane failed (despite the use of experienced riggers), and the whole 200 ft mess landed on the cab of the crane.

As Gary said, the bending moment is huge, sometimes fatally so.

Hi,
Bought a US$10 aerosol can of contact cleaner. Used it
on some gear and it fixed a relay problem for about 10 days.
Now, I notice the metal contacts have a green film on
them, and the relays are again intermittant. The film
is transparent, not opaque, so I guess it is a residue
of the contact cleaner rather than oxidation.

Can anyone suggest a contact cleaner that leaves NO
residue, yet rids oxidation of exposed
metal contacts? Does such a beast exist? The stuff
I bought is from Germany, called Kontax if I recall.

I have tried DEOXIT with a similar result. Could the
base metal be causing the problem?

thanks,
Joe

Tim - There were a couple of really good articles in QST on this subject. They have been reprinted in several of the ARRL tech books. I see them in W1FB's Design Notebook. They are by Wes Haywood, W7ZOI and originally apeared in the May 82 and July 87 QSTs . Doug DeMaw presented a Testing device used to determine crystal values (needed for the calculations in Wes's articles) in the Jan 90 QST.

Wes and Doug do a great job of explaining how to build the ladder filters, but I think they overestimate the ability of your average homebrewers when they imply that this process is sort of easy. It looked fairly formiidable to me. The circuit for the tester was almost as complicated as that of the receiver I was building.

I think I found a temporary way around the problem: Instead of building the 250 Hz three crystal ladder filter, I used a very simple, one crystal filter. I have a dual gate MOSFET mixer and a dual gate MOSFET IF amp. One of my 3.579 rocks went between the drain of the mixer and the input of the IF amp with a 2.7 k resistor to ground. I borrowed the idea from another W1FB circuit. The bandwith is a lot wider, but I still get single signal effect, have had lots of very pleasant CW QSOs and have the added benefit of being able to listen to SSB signals. (they sound great). I'll build the ladder filter later.

Good luck. Hope this helps. 73 de N2CQR Bill

Cramolin is indeed expensive, but great stuff. However, it's not really
a contact cleaner, but a contact lubricant. I generally use one of the
spray type cleaners (TF type), which remove the gunk AND lube, then put
a super thin film of the cramolin on the contacts to lube/protect.

Some of the cheap cleaners are actually cleaner/lube, which can cause
corrosion on some metals, depending on what film is left and what metals
the contacts are made of. Really tricky stuff since you generally can't
figure out either one (it's the ol' test of compatibility in a spot that
won't show). Perhaps this is the problem the original poster is having.

Hi from RSA
Does anyone know the mod for Yaesu CPU-2500R to get the full frequency
range? Please reply to barend@fast.co.za

I second that. A TTL gate produces enough high-frequency energy to cause a
lot of interference. There's no excuse for not following it with a filter.

I wouldn't have thought that that was ever in question. Given your
situation, however, the question should be is CW the BEST way to get
though noise? The answer is no. Obviously in this case, it is the most
cost-effective (as the system already exists).

> YES I KNOW THAT NOT ALL HAMS CAN READ CW THROUGH THE NOISE, BUT THOSE

> AFTER
> ALL.

Voice provides practically the WORST way of passing messages over the air (except where the content has to explained interactively). It's not suprising that voice nets can take longer than "written" contacts. The more accurate comparison is to compare different text based systems with each other, that is, comparing Morse coding to FEC type coding, for example.

> CW WAS NEVER DEAD AT K5KV AND IS REVIVED AT NNN0LGN.

CW will never die as long as people want to use it (however, compulsion does not engender interest, rather it breeds rejection).

Hi Joe,
The base metal could very well be showing through, probably time to
change the relays The BEST contact cleaner I"ve ever used is called
CRAMOLIN. At work we call it "Technician in a can". At $30.00 for 2
ounces it had better be. Don't let the price scare you off a little bit
goes a long way and this stuff really works. Does anybody else Know about
this stuff?

# 1601. Re: PL259 Attachment to COAX Cable

Newsgroup: rec.radio.amateur.homebrew

Good technique here, same as I've been using for (my god am I that old?)
over 20 years. Also, silver PL-259s with gold center contacts are much
easier to deal with than the cheaper nickel-plated ones, IMHO.

## 1602. Cartons of components...

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-05 00:00:00 UTC
From: 629371@worldnet.att.net
Message-ID: <33e726df.11184922@netnews.worldnet.att.net>
Source record: 92059

Last week, I asked for some ideas in how to dispose of some electronic components from a friend of mine fathers estate who passed away recently. About 4 people responded with offers to buy the cartons of components sight unseen but I didn't feel we could do that - without at least an idea of what was in the boxes (thanks anyway).

We've now sorted through the cartons and combined everything into 3 (heavy) but shippable boxes and found the following: (this is NOT a complete list by any means! :))

1st box - is full of various ganged tuning capacitors of different sizes, a lot of ceramic core, wound inductors (some variable, I believe they're called roller inductors), of various sizes - some look new, some look used. There are some complete tuning assemblies (with knobs) out of some unknown equipment. Several new (in carton) coils of various sizes.

2nd box - must be hundreds of (primarily new) electronic components, consisting of packages of resistors, capicitors, diodes, mini reostats and misc electronic construction aids, wire wrap holders, heat shrink tubing, etc., etc....for building gear. It's a treasure chest if you build your own stuff - we don't.

3rd box - consists of some various metal and plastic enclosures (for building your own projects), some meters (miliamp, volt, counters, etc) plus a few different transformers, some new speakers, various gauges of wire, and more packaged resistors, etc...plus wire wound coils in storage trays with other components...

This is just a rough idea of what's involved. There are other items we've haven't listed...

If the people who offered to purchase the gear would please re-send their offer (now that you have an idea of what's involved), we can get this stuff moving. I will need help on the shipping - these cartons are heavy - include your zip code, so I can get an estimated cost.

This is obviously an "as is" transaction. I'm sure in my own mind that everything involved must be worth a few hundred dollars (probably more), but I certainly can'tt guarantee anything.

Open to any offers - or trades for any type of HF gear or accessories. In the case of a trade, we'll take the value of the trade and put the money into the estate trust ourselves...

Thanks for reading this very long post...

John Lewis (and friend Paul)

>Tim, ka8ddz

While it is true that a range of capacitances will give a range of frequencies
or reactions by a circuit, with the inductance held steady, it is also true that
Q is not linear through that range. check it out: Hi-H, Lo-C will give you the
same LC resultant as the proper Hi-c, Lo-H circuit, but they are not going
to interchange at all well.

So, the thing is to use a major cap of a fixed valye, and a major coil of a
fixed value, and all else is compromise, or cut-to-fit.

Radio has come a long way since meters were 20 K-Ohm/Volt, and caps
and resistors were +/- 20% standard, but it is still largely cut and try, and
try to guess what went wrong.

Anent which, why don't you try the circuit you mention?
It should be fun and give you a lot of learning for a small cost.

Good luck

By far the best technique is to use N-type or BNC plugs
on your cable. If you have to have an SO239 - like on the
back of a rig, get an adapter to whatever plug
you are using.

PL259s are bad news above HF, difficult to fit without
damaging the coax and often of such low quality that they
don't screw together properly or take solder.

If you really must use a PL259 - get it from Greenpar or
MA/COM.

FCC regulations require an absolute minimum spurious emission
attentuation of 30 dB for an HF transmitter running 5 W or less.

In addition, Part 97 stipulates that if any spurious emission causes
interference to another radio service (ie, your neighbor's TV), you would
need to attenuate the spurious to whatever level is required. If you use
a TTL device on HF, it is probable that your harmonics will extend into
the VHF range, requiring filtering as needed.

At -30 dBc, the 5 watt signal could have harmonics at a level of 5 mW. A
number of us QRP types have used less power than that to work DX under
ideal conditions. A VHF signal level of 5 mW will cause severe
interfernece to a nearby TV.

Actually Jason, the "feedline" is probably functioning as a component of
the antenna....in the form of a "long wire"....adding to the reception
ability. SWR, antenna impedance, etc are important when transmitting,
not usually when receiving only. You may find better reception by using
MFJ's SWL tuner...I forget the model number.

There is an informal group of amateur radio operators that use Macintosh computers called "Macnet" with > 800 members world-wide.

We stay in touch with each other via packet & Internet and we have a HyperCard stack that tells the story of each of us called "Macnet Roster" that list

o CALL SIGN @ HOME PBBS
o FULL NAME
o Street ADDRESS
o CITY, STATE, ZIP
o INTERNET ADDRESS
o MACS USED
o RADIOS USED
o SOFTWARE USED
o PASSIONS
o COMMENTS

Macnet members can then communicate with one another directly or use our Macnet Moderated Mailing List to pose comments or questions to all of us on the Net.

To join Macnet, put YOUR INFO (via EMAIL or via disk using TEACH TEXT on a formatted disk in a self addressed and stamped disk mailer that is in a large envelope clearly marked "ROSTER").

http://www.mv.com/ipusers/wd1v/Page2.html

-------<sent to all new Macnet Subscribers & Macnet Roster Updates>---------

Welcome to Macnet!

A trip to my home page also reveals there are many superb files and programs for amateur radio operators that want to use Mac computers. See more details in January 1997 QST, page 100. http://www.mv.com/ipusers/wd1v/

* Ham Radio Test Simulators - where you can go from Novice to Extra Class practicing the actual tests right on your Mac! Check out the info on the new NO CODE license or scramble your neurons and learn Morse on the Mac too!

* Macnet Email Reflector - send an Email to all Macnet users on the Internet.

* Macnet Roster - a virtual "Who's Who" HyperCard stack with > 800 entries giving the names, addresses, phone numbers, of radio operators all over the world that are using Macs. Check out their projects and

their passions and put a design on your Mac Radio future. See what neat things are being done with Macs and Ham Radio!

* Mac Ham Radio Software Listing - as the name implies, its "The List" of the latest - much of it with FTP links so what you see is what you can get your new programs with just a click.

* Ham Radio.FAQ - compiled on a Mac with a lots of links to great Mac FTP sites for radio, electronic engineering, and similar data.

On the 757 and computer control, I've found it easy to do and it requires
very little hardware. The simplest interface I have built consisted of an
optoisolator and nothing else contained in a nine pin D-shell connector on
the rear of my laptop. The optoisolator is wired with the collector and
emitter across the data input pins on the rear of the 757 (emitter at
ground, collector on the data input pin). The LED side of the optoisolator
is driven very simply by wiring the LED connections such that the diode is
turned ON when the data pin sends a ONE (data pin goes to the RS232 level
of -3 to -15 volts). No current limiting resistor is needed because the
port hardware can only source 10 ma anyhow. When a zero is sent, the
polarity goes positive, but an LED is still a diode, so it doesn't conduct
in that direction. It works and has been in use in my car on long trips
with a program I wrote to scan my 757 through interesting frequencies, or
do channelised tuning and at home to scan interesting shortwave
frequencies. (it was very useful during the gulf war to be able to scan
tables of frequecies for interesting listening)

The 757 expects to see data at 4800 baud, and you have to follow the
information in the manual on how to send the data (basically you push 5
bytes of information onto a stack). I uploaded a program in Turbo Pascal
to CI$ several months ago that I wrote to control my 757. It's in the
hamnet software area and called something like 757CAT.ZIP. I think I put
the pascal source and the .exe both on there.

The only drawback I could see was that in the 757GX, there is no provision
to send data back out from the radio to the computer. But that doesn't
make a lot of difference. I think the GXII does do bidirectional data, and
my 736 will do some but basically the Yaesu radios are mostly set up

just
to accept external commands simply and easily.

As far as the hardware requirements, none of the radios mentioned seem
to
be any more hardware ready for computer control than the 757. They all
seen to require some sort of RS232 to TTL level interface box, usually
priced in the $100 range. And you can build a variety of homebrewed
solutions for that using max232's, 1488/1489's or doing it dirt simple
with the optoisolator idea above.

Roger, Roger Tony, :)

My two speed Weller does a fine job. I saw a "helpfull Hint" in QST
a ways back and I used my Dremmel tool to grind a new element down to
fit the hole in the collar of the PL-259 and it does a super fast job of
putting a PL-259 together.

Check the larger hardware stores. I just bought a 250 watt Weller gun at one of the bigger Coast-To-Coast hardware stores. They only had one in stock and it cost around $40, but they are out there.

Ditto,
I have a dual range gun and no problem soldering anything practically.
When I need more heat, just sqeeze the trigger for higher temp. Lot of
times the tip gets loose from the heat and it does not work well. Just
make sure to tighten the screws holding the tip.

Yes, they still make them. I just bought one this past weekend. 200/250 or
260 Watt, labelled by Waller as "Professional" model.

Is an 80 Watt iron sufficient? There's a log more thermal mass on it than
on any of the guns' tips, but people here have been recommending 100 Watt
irons.

<parkerp@pcug.org.au> wrote:

:Some of us enjoy being amateurs and like cutting and trying. If I wanted
:to learn from books and doing computer simulation models, I'd be an
:engineer and not a ham. Some of us have no interest in theory and/or
:can't be bothered to spend time learning it (once we have our tickets).

This is exactly what the "perpetual motion device" designers say. I think
they have a number of their own news groups :)

But I would bet that you really know quite a bit of theory. Just because
you don't sit down with a pen and paper or computer and work out every
detail in advance does not mean that you're not doing engineering. You
just have a much better intuitive idea of how electronics works. Most of
the time I design equipment in my head and make the schematic later. I
have a hybrid DDS/PLL synthesizer sitting on the shelf. It has no
schematic since I have some fine tuning to do- but it still works.

Some of my friends have asked me in the past why I build all these strange
contraptions. My reply is that its ART plain and simple. Some people like
to paint or sculpture. I like to construct hardware- engineering or no
engineering. I think a lot of hams fall into the same category. Maybe you
do to. But then in the next paragraph you say you are building equiment
that you intend to "use" for some "purpose": ham radio. Thats pretty much
the definition of engineering! whether you use CAD or not
:
:I'll leave it to the propeller-heads with all their clever computer
:models to argue some arcane point amongst themselves, while I'll just
:reach over and plug the soldering iron in, build a rig and actually use
:it on air, and not just operate it into a high-tech CRO or power meter,
:say "it works" and move over to the next academic exercise on the
:computer.

Source record: 91913

I just wanted to give a big Thank You! to all the wonderful replies. I tightened the screws on the Weller Solder Gun and got a little better result out of it, although still not enough to do a decent job on the PL259's. I tried using a 100 watt soldering iron, and I just can't seem to get the PL259 hot enough to melt solder inside of it. I ended up melting all the insulating material away though :). So that tells me I'm getting it hot enough, not sure why solder isn't melting. I'm using Sn63, 1/32" solder....any other types I should be looking at? When I touched the iron to the tip of the PL259, I was able to melt solder into it no problem, yet it didn't have the "flow" characteristics I expected it to. It just sort of melted and "sat" there. When we melted it on field day, it seemed to turn to a real fine liquid and just flowed into the connector around the center tip.

Thanks again for all your help and maybe I'll get the hang of this yet. I'm off to try the 7th PL259 now :).

73,
Niel Brieger

Message-ID: <33EBD0CE.7422@flash.net>
Source record: 91916
Body handling: HTML body converted to readable text

This is a multi-part message in MIME format.

My DC receiver saga continues. After getting her tuned up on on 40 (it sounds soooo clean) I decided to implement VVC tuning, I like it because it seems to be a little more mechanically stable although I know it has shortcommings.

I can get about 35Khz using a 4001 diode (hey it's what I had in the junk box)
Seems to be a real winner, BUT, I am coupling it to the LC circuit via a 5pf cap in series with the diode, if I understand this right, that means Im only able to change the LC circuit by a maximum of 5pf yes? Series capacitor formula?

When I try to use any higher than 5pf to connect the diode in the circuit it dies, dead as a doornail, nada. If I use a tuning cap I can get over 150Khz so I believe the LC circuit is OK. The circuit will NOT take more than 5pf in series with the VVC diode.
Any ideas?

DeoxIT is the new Cramolin Red, they had to reformulate it to take
the freon out. Same folks (Caig Labs). Cramolin Blue is replaced
by PreservIT.

Well, normally you cannot use just any oscillator; an overtone
oscillator will usually have a tuned circuit at the overtone. Look for
an appropriate circuit. (Read "usually" as "almost always"!) But why
not just use a harmonic of the fundamental. The frequency will be right
on and if the oscillator is one making generous harmonics you are in
with no tuning to get it running or anything of the sort. You could use
a 10 MHz crystal and hit 50 MHz on the 5 th harmonic, and 10 MHz is
cheap (but the cheap ones may not be all that exact, though you can pull
it to 10 MHz with a goodd reference.

Hmmmm SP prefix is PLESSEY semiconductors, and though they were
a major maker of ECL high-speed prescalers, they also made some larger
scale counter devices. From memory, that part number seems to be right
for some sort of counter/prescaler, but I've just checked and I've only
got their linear radio circuits, and fast ADC/DAC databooks left.

Oh, I hope the ARRL Antenna Book doesn't really say that, because the J is a *half*-wave vertical element end-fed by a quarter-wave matching stub. It can be considered a special case of the antenna older-time MF and HF operators called a Zepp.

> Yet I hear ham after ham singing the glories of the j-pole. Have I
> missed something? Does the j-pole really have 11 db gain, as some
> have said quite definitely on the repeater?

Maybe compared to something like a really bad "rubber duck" a J could exhibit a gain of 11 dB, but not compared to something like a quarter-wave groundplane or half-wave dipole. It's just a half-wavelength radiator, after all.

Yeah, you may have. What I want to do is use the earpiece in
the CB unit. I'm not a ham, so is there something about CB I'm
missing? I thought that the handheld unit's have better range than the
small RS unit I have. I also have an old Kenwood 2-meter radio, but no
license to use it, so that's out of the question until I get my
license at least.

James Patterson <PattersJ@ecid.cig.mot.com> wrote:
>Does anyone know any good mods for the 757?

I did a bunch of mods to my FT-757/I. I added an RF choke
and decoupling cap right where the +12V enters to fix a bad
TVI problem due to the power supply leads radiating.

I added an extra IF gain stage using a BF980 FET.
Big improvement in receiver.

I added the Fox Tango CW filter with a second additional IF gain
stage that is only switched in when the filter is in place.

I added some filter switching that allows me to use the CW filter
in lower sideband mode for RTTY.

I attenuated the CW sidetone so it was reasonable with headphones.

I understand there is a time constant capacitor you can change that
speeds up the AGC so that AMTOR works better.

Heck, I've used a 40 watt Weller WTCP soldering station, with a heavy 800 degree tip. Those things have remarkable heat transfer capability. Of course, it helps to use Teflon-insulated coax so you don't end up with melted insulation all over. I've found in the past that putting a close-wound layer of 28ga or 30ga silvered wire over the braid helps a lot, especially on coax with "thin" braid coverage. If the silvered wire is clean, the solder wicks into it very quickly, and it helps a lot to keep the melted polyethylene dielectric from oozing out the holes.

Has anyone implemented a mod for the FT757 that switches to the correct
sideband when you change bands?
It's not programmable, so I can't change bands with the remote base.
It looks like there are lots of options to swizzle the switch
connections,
I just have never figured out how to do it in the space available
inside the unit. One PAL would do it, but the voltages are 8 volts.

No, I'm not buying a GXII.
TIA, miker

Pl259 connectors are an inherintley poor connector at any frequency because the center pin moves and changes the impedance. I would suggest that for VHF, and especially for UHF you should use Type "N" connectors or BNC. they are stable.

He was asking about taking the earphone/microphone/vox and applying that part to a cb radio. It could be done, but is probably not reasonable for inexperienced people (experienced people wouldn't have to ask). There *are* units already made this way for cb operation on motorcycles. I helped a neighbor install one on his motorcycle. It also had an "intercom" function so he and his wife could converse more or less normally while on the road. Sorry, they're cruising somewhere and I don't even remember the brand name. Try looking in rv and motorcycle newsgroups for more info. There is also a cb newsgroup if I remember correctly.

Source record: 92001

Hi

I have just built a 6 meter reciever and want to tune the local oscillator in. The easiest and cheapest way I know how to do this is to build a crystal oscillator.

Because an approx 50 MHz crystal is expensive ie $20, is it possible to say use a 17.73 MHz crystal and use its third overtone ie around 53 MHz. As this crystal is only a few dollars.

I have a siimple schematic for a crystal osillator, but do you have to do anything special to the circuit to make sure you get the third overtone. Or do you get it anyway once the crystal is operating and no high pass filters are added to the circuit.

I hope this makes some sense because I am only new at this stuff

Source record: 92002

Some of us enjoy being amateurs and like cutting and trying. If I wanted to learn from books and doing computer simulation models, I'd be an engineer and not a ham. Some of us have no interest in theory and/or can't be bothered to spend time learning it (once we have our tickets).

I'll leave it to the propeller-heads with all their clever computer models to argue some arcane point amongst themselves, while I'll just reach over and plug the soldering iron in, build a rig and actually use it on air, and not just operate it into a high-tech CRO or power meter, say "it works" and move over to the next academic exercise on the computer.

>have said quite definitely on the repeater?

Surely it has 11 dB gain over a rubber duck. So has a simple ground plane,
which is much easier to construct.

Not the one I live in either. Like most engineers I know, the circuits I design
generally work as designed when first prototyped. If not, it is usually
an error building the prototype or a design oversight which wouldn't have
happened if normal attention had been paid to the particular detail. In the
vast majority of cases, if you know what the final circuit is actually supposed
to do, then you are expected to get it right the first time. In my world,
the majority of the time in the lab spent fooling around is usually
trying to either figure out what the real system requirements are or what
somebody elses widget actually does.

# 1651. Re: Crystals and overtones

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-08 00:00:00 UTC
From: "John M. Franke" <j.m.franke@larc.nasa.gov>
Message-ID: <33EB849B.1783@larc.nasa.gov>
Source record: 92006

There is a difference between third overtone and third harmonic. The third overtone of the crystal is not exactly equal to the third harmonic. Harmonics are exact multiples of the oscillator frequency, overtones are not. So, build the crystal oscillator for 17.73 MHz and you should have a strong third harmonic at 53.19 MHz.
By the way, a high pass filter would let the harmonics pass, a low pass filter would block the harmonics (assuming the corner frequency was the crystal frequency).
Hope this helps,
John

Lou Hinshaw replies . . .
Several people snapped at me for saying something they didn't like, and one even said I sould learn radio instead of wasting my time on CW. I never did do well ion CW, but I believe it is needed, so I try to keep able to use it.

Anent not learning radio, though, that just makes my point. He/she knows so little of the subject that if I don't agree with them, I must not know radio. I don't know radio at all. I built my first receiver in 1952, and my latest project was a 24-Amp power supply last week where I redesigned the transformer, and designed an inrush current limiter, and I still don't know radio.

I am one with Einstein on that. He said "The more I study the macrocosm and microcosm, the more I become appalled at my own ignorance." Amen. But, since I am, in all my ignorance, in such good company, I will keep on trying to cut and fit like always. The tools get closer, the parts get better (didn't I say we've come a long way?) but it is still cut and try and guess what went bad. See the next post:

GET1421
Senior RF Design Engineer:
Responsible for designing the RF portion of high-performance 900 MHz direct sequence spread spectrum transceivers for wireless local area network. Requires BSEE/MSEE and 2+ years' experience in design of high-performance VHF/UHF receivers. 4+ years' experience in the design of RF circuits, including filters, mixers, oscillators, synthesizers, low-noise amplifiers, phase-locked loops and auto gain control is also required. Designing for medium volume production and 900 MHz spread spectrum receivers is a plus, as is RF ASIC development. To apply for this position, please contact GETcareers@gettec.com or fax your resume to General Engineering Tectonics @ 209-469-2614 or visit our web site at http://www.gettec.com and fill out our candidate profile form. Please be sure to include the position identification code, this is very important, it makes it much easier for us to serve you.

Kelvin, you will get the third harmonic, as well as all the others) at
the same time. Each higher order harmonic is weaker than the last. The
way to use the one you want is to build an amplifier with an input and
output tuned to the harmonic you want. This will eliminate the unwanted
ones and the output can be fed to your mixer or if the one you want is
strong enough the mixer input can be tuned to it.

>73, Dick

MOST decent-quality (excluding the popular corner-store source) 259s
are that way: Look inside the cable barrell and see if it is threaded. If so,
you should find the thread is slightly larger than the cable.

BUT:

Turn the shield braid back over the cable and screw it into the barrell and
you have a very good fit indeed. No soldering required. That is for stuff the
size of RG-8U. For stuff the size of RG-58U, there is an insert that you turn
the braid back over and proceed as above. Elementary, Watson.

Overtone crystals always operate in a series-resonant mode, which is different than the third harmonic of the fundamental parallel resonant mode.

The best of all worlds is an optimum mix of design, simulation and experimentation. Invariably, I find that at least one loop-around through this cycle is needed because of unforseen discrepancies and deficiencies that show up in the experimental phase. This loop-around process is very enlightening and it leads to something that doesn't just "work", but works much better than on the first go-around. There is a school of thought that the breadboard stage is no longer needed. I do not believe that for one moment.

Kool -Amp. From Portland Oregon. They manufacture a scouring powder that you wet with water and rub onto copper, silver, brass, anything lower on the work function, and it deposits pure silver on the base metal. Power companies have used it for years to replate relay contacts and switches to lower the resistance of the contact...Therefore the name.

I buy a pound jar every 30 years, so am a bit out of touch on price but probably in the neighborhood of $40 per pound. 1 pound usually lasts nearly a lifetime.

Sorry for coming in a bit late on this one -- I actually had a summer vacation this year :-)

Of the several replies I read, I didn't see anyone mention filing the plating off the 259. With "silver plated" 259's, you don't need to do this, but the nickel-plated ones can be tougher to solder to. I routinely file the plating off around the solder holes and use the point of the file to scrape it off the inside of the hole. These cleaned spots take solder much more readily.

Hello Wes.

I have read that they always operate in the series mode. My personal experience agrees with that. The overtone circuits that I have used all try to encourage that mode of oscillation using the series mode. When you buy an overtone xtal the frequency marked on the can is the series-mode overtone frequency. Also, the fundamental parallel mode has to be suppressed somehow. I think that is right, as far as I know (I am not an expert on xtal osc).

I have a quote from the book "Crystal Oscillator Design" by Frerking:

"Overtone crystals are nearly always operated at series resonance". There are also circuit examples to verify.

Coax is never damaged if you use Pl259 plugs with flanged inserts and
compression sleeve as with N-type plugs . These are available also
for RG58 cable ,from a UK supplier called Westlake. Today I saw the
latter type made by MACOM ,possibly American.

Technically, an overtone is the harmonic number plus one...A third
overtone crystal is on the fourth harmonic. I do not know what current
ham jargon is on this subject. You can modify the feedback such that
the overtone is emphasized in the oscillation. There are a number of
ways to do this including an LC tank in positive feedback. Look at the
schematic for an overtone oscillator. I haven't looked at the new ones,
but the older ARRL handbooks had such things.

I have an MFJ Receiver Antenna Tuner / Preamplifier Model # MFJ 959B
connected to my Kenwood R-1000 SW receiver. I would strongly recommend
this tunner. It does an excellent job for me. The tuner helps a lot on
bands that the antenna is not resonant on. Brings the signals up 3 or
4 S units on the meter sometimes. The preamp is adjustable from the
front panel, so very weak signals can be amplified. It also has an
attenuator which is handy when strong signals overwhelm the receiver.
On the rear panel, it has connectors for two receivers and two
antennas, and a jack for 12 volts DC to power the unit. Cost from MFJ
is $99.00. It's well worth the money.

> Ralph
Whatever this business about "an overtone is the harmonic number plus
one.." is supposed to mean, it is correct the overtone and the harmonic
which are near each other (however you may choose to name or count them)
are not on exactly the same frequency. The harmonics are just a kind if
distortion produced when the oscillator is not producing an exact
sinewave output. (The electronics are probably more responsible than
the crystal in nearly every case.) The harmonics are exact multiples of
the fundamental frequency at which the crystal is running. In an
overtone system the crystal itself is not operating at the "fundamental"
frequency at all and the oscillator produces little if any fundamental.
To picture what is happening, sketch a 1/2 wavelength sine and then
under it a wave with 3/2 wavelenghts in the same distance as the above
wave needed for a single half wavelength. If you could photograph the
crystal operating on the third overtone it would be making motions of
the latter kind. You can extend the idea to 5/2 or 9/2 or beyond. The
same effect can be seen in a taut string.
On account of little "end effects" the overtones will not be at
exactly the harmonics of the fundamental, whether in a quartz
oscillator, a plucked string or a blown flute unless measures are taken
to fix the "errors".

bad.
> See the next post:

Lou,

If you were truly smart enough to recognize your own ignorance, (that you
compare
yourself with Einstein is laughable) then you would attempt to do something
about it by
learning how to design and simulate before you build stuff that doesn't
work, instead
of simply accepting your old-fashioned guess/cut/try/fail/guess mode as
"the way things
are done" ... that is NOT how modern design is done ...

The critics (myself included) were blasting you, not for making mistakes,
but for attempting

to assert that "that's just the way it is/must be" ... that's a bad message to send to those
who might be interested in learning something about radio ... you're saying, in essence,
that "it's a frustrating exercise in try/fail/try_again," when, in fact, it's a science that can be
mastered and where knowledge, skill, and the use of modern techniques/tools pay off in results ...

In the "real world" we design things based on an understanding of theory,

then we simulate the circuit to verify that our design ideas work as we expect
(and, with Monte Carlo analysis techniques we consider the effects of variations
in component values, temperature, supply voltages, etc.) ...

we can even optimize for specified performance parameters over specified ranges
of component value variations, temperature, supply voltage, etc.,

and only then do we actually build hardware, rather confident that it will work as expected.

(when you know what you're doing, it's MUCH faster, easier, and more efficient to "bread-
board" your circuits on the computer than by kludging together a bunch of parts that end
up being wasted as you cycle endlessly and cluelessly through your "cut and try" cycles)

That's the "real world" ... it's a place where science, knowledge, and skill make things work,
not the backward world of superstition, guesswork, and stagnation that so many beepers
embrace in the name of "tradition" (and other pseudo-religious dogma/mantras) ...

It's like the difference between modern medicine (MRIs, microsurgery, modern drugs, etc.)
and some primitive native witchdoctor whose answer to everything is to repetitively chant the
old mantras and rub mud on the patient. That's the difference between my perception of the
"real world" and yours ...

HI Steve;
There are several kits you can purchase. The material comes in powder form and you can apply it in a bathroom sink. This method just provides a flash coating but it will prevent copper and brass discoloration and makes projects look more professional. If your using the coating for improved conductivity its a waste of time. If you can't find a place to purchase drop me an email and I'll check my files; I believe Newark distributors carries the material. 73 Bill N4Mxf@aol.com

Kelvin - try building a 3rd overtone crystal oscillator (identical to what you'd use if you had a 50 MHz xtal). It may well work with the 17.73 MHz xtal. To check that the crystal is operating in its overtone mode (and not in its fundamental) tune your receiver around 17.73. If you don't hear anything there, but there's output on 50 Mhz, you've done it right.

However, if you use a crystal in this fashion, you won't be able to pull its frequency (ie your receiver will be fixed frequency). Operating the xtal in its fundamental mode and multiplying (provided you have adequate filtering) is best if you want frequency agility. Provided you're using the right kind of crystal (HC6/U), you should be able to obtain between 20 and 40 kHz VXO shift on 17 MHz (and 60-120 kHz on 50 MHz).

I would actually disagree with this. RF only follows in the top few
microns of a conductor and certainly it will improve material
conductivity. It will not be a solid layer though and it will certainly
be hard to run high power through such a layer. It will stop detuning
through tarnishing.

Hi Bart OM,

After 32 years in R/D work as a designer and manager, and currently a hardware designer, I can say that the breadboard phase is an essential one, no matter how much analysis and simulation is done beforehand. It is my experience that there is always something that was assumed that shouldn't have been, or unforseen, or just plain overlooked, that finally shows up in what you hoped would be just a "verification" of your design. So you go around the test-learn-test loop at least once , typically, several times, even with modern tools and techniques, at least with analog and power design. I have seen complex ASICS designed and frozen into silicon, and "work" the first time. But not to the nth degree; we always find something that we need to change before design freeze, even with digital logic IC's, which are easier to simulate

accurately than analog and/or mixed-signal designs.
Having said all of the foregoing, let's remember back when some of us did know "nothing" about what we were doing, building ham gear, and bumbling around until it worked. It was a magical time! I learned a lot, and it fostered motivation to learn more, and was exciting stuff. I am glad I went through it because it sparked my imagination and love of electronics (so many have noted that the word "amateur" is derived from the Latin "Amo or Amare" which means for the love of it). So if you are not designing for a living, you can use ANY method that suits you, efficient or not, because efficiency has nothing to do with it at all. Cut, try, guess: all's fair, cuz it's for fun, folks.

Keep on tinkering...

73,

Don, W6JL

I have heard of people using spent photographic developing solution for silver plating. This method also results in a very thin layer since once the copper surface is gone, there is no more electrochemical reaction. You'd think that it would only get one molecular layer thick, but who knows.

You could also go to a chemical supply store and buy silver nitrate. It will also give a thin layer. You'd have to supply an external source of energy to plate it any thicker. (this stuff is caustic to skin, they use it for cauterizing severe nosebleeds- sticks of it look like sparklers)

Hope you can stand the flack Lou, ;) there's a lot of otherwise sane
and intelligent people who will insist that you still have to solder
the braid.
For the record I changed from clamp to screw in in 1980 and cannot
attribute one failure to lack of soldering the braid.
The original post mentioned field day. The clamp type 259's or for
better impedance match "N" type's, will stand a weekend of most
weather conditions without the need to tape them up.

Apparently by reducing the C in the LC circuit allowed greater use of the VVC diode, still not sure why it was dropping out (I would think the freq would just go higher or lower) but by removing a 56pf in parallel with the coil and replacing it with 47, I can now use 10pf to couple the VVC resulting in over 100Khz coverage.

Right on, Bill
Give it all the fancy names you wish, it is still cut & try even on a; computer
or after, as I do, on a plug-in breadboard so I don't waste parts, chips, etc.,
but can recycle them. Poli-tickle Correcty, me. First get an idea. Next make
it fit whatever you want to by redesign (cut to fit) then simulate a TRYOUT
on your computer, then breadboard it to see if it works in the real world, then
make it on a metal chassis or PC board, or whatever, and then hope it
doesn't smoke when it is supposed to be ready.

BTW, my comparison of myself with Einstein seemed to me on rereading to
be very obviously lmited to the ignorance we both profess.

There is indeed a loop back and refit process in most things electronical,
and a 1% tolerance is still a tolerance, and IRC, for whom I worked in the
'70s, made adjustment devices to allow fitting without rebuilding. They called
them trim pots. From the rants I have heard blasting me, I must assume those
ENGINEERS no longer use trim pots.

Or do they?

Ciao, and Bill, thank you for a clear post.

I've been ridiculed a few times for daring to say things like
"you can successfully model RF circuitry". I don't even get
to mention that the accuracy of the simulation depends on the
accuracy of the model, which is an incentive to understand how
things really work, not dodging reality by saying things like
"you gotta tweak it best ya can".

Now, simulations aren't gospel, like Tom says. However, electronic
circuitry works on generally well-known principles that aren't
difficult to model by themselves, you just need to have a model
that reflects reality. You learn that capacitors have series L
and R values, that inductors have series R and shunt C, and skin
effect modifies the series depending on frequency. You learn
how to work with S-parameters. You get the idea. You can tinker
something into existence and hope it works under changing conditions,
or you can design something by understanding how it works.

Here are the instructions for the Better J-Pole.
Remember, the spacing is important, If you use any material
other than what is shown here, you may have to change the spacing
to get a low SWR.
Please e-mail me, and let me know how this works out.
and let me know if you have any questions.
You may want to print the page showing the J-Poles at....
<A HREF="http://members.aol.com/Arrow146/index.html">Arrow Antenna</A>
or
http://Members.aol.com/Arrow146/index.html

Construction Plans for the Model J146 2 Meter Solid Aluminum J-Pole

Parts Needed:

Radio Shack # 21-961 3/8"-24/SO239 Mount (Mobile CB Antenna)
Radio Shack # 15-826 TV Mast U-Bolt Clamp Assembly
About 80 inches of 3/8" diameter Solid Aluminum Rod.
5 1/2 inch piece of strut angle Aluminum 1 1/2" X 1 1/2" X 3/16" Thick.
2 Stainless Jam Nuts 3/8-24 thread

Tools needed:

Drill Press with drill Bits up to 1/2".
Tap & Die for 3/8-24 thread.
Sander or file to de-burr the cut edges.
2 9/16 wrenches & a 3/4 wrench.
Vice-grips

Make sure the piece of angle Aluminum is exactly 5 1/2 inches long.
Drill 2 1/4" holes on one side, centered to fit the U-Bolt for mounting.
On the other surface of the angle
Measure in 1/2" in from each end and drill a 1/4" pilot hole.
This should give you 4 1/2" from center to center of the two holes.
Redrill one of the pilot holes to 11/32" Then tap the hole with a 3/8-24
Tap.

Redrill the other pilot hole to 1/2&#65533;
Finish as required.

Cut a piece of the 3/8&#65533; Aluminum rod to about 59&#65533;.
Attach a vice-grip to one end.
Using a 3/8-24 Die cut in about 8 threads in the other end.
Screw on the Coupling Nut that came with the SO239 Mount
Tighten as much as you can.
Measure the rod & coupling nut & cut to exactly 57 1/2&#65533;

Cut a piece of the 3/8&#65533; Aluminum rod to about 21&#65533;
Attach a vice-grip to one end.
Using a 3/8-24 Die cut in about 14 threads in the other end.
(If you don&#65533;t have jam nuts, cut enough threads for 2 nuts & the thickness
of the angle bracket.)
Screw on one of the Jam nuts & tighten as much as you can.
Measure from the bottom of the nut and cut the rod to exactly 19 1/4&#65533;
(Remember the nut must be included in the Measurement.)
(Put a small amount of grease on the threads)
Screw the element into the threaded hole of the angle bracket and tighten.
Screw on the other nut and tighten it.
Attach the 57 1/2&#65533; element in the 1/2&#65533; hole using the rest of the SO239
Mount.
Mount & test your new antenna. SWR should be < 1.2-1 at 146 MHz and
<1.4-1 at 144 &148 MHz.

```
This Model J146 is available from Arrow Antenna for only $ 35.
The J146/440 Dual Band with single SO239 feed is only $ 43.
Please add $ 6. Shipping & Handling per order (for US Funds).

Have a brand new Dow-Key "bypass" antenna relay with SO-239 connectors, 110v AC but no accessory contacts. Anybody know what they go for on the used market?

Thanks,

Evan
K9SQG@AOL.com

# 1694. Simple 170Mhz receiver ?

Hi ... thanks for reading this request.

I am looking for a design for a simple VHF receiver to operate on a single freq in the 170 Mhz region.

With the multitute of special "chips" about it must nearly be at the stage of building a receiver with a single chip or am I out of touch and it is already possible ?

I would be interested to hear from anyone who may have come up with such a design.

Thanks Alan VK5BWG

Try to get hold of a back copy of Ham Radio for February 1985.

K9EYY did an excellent article on "Safe, Sensible Silverplating".
The method used spent photographic fixer, a 6 volt battery, a 10K pot
and a 0-100 mA meter.
You can plate to whatever thickness you want. I have used this method to
plate repeater cavity filters with excellent results.

Hi Rob. Almost missed your post, I don't usually review old notes. I may be the one who led you astray, I just went to the workshop and got my second jar in a lifetime and it's COOL-AMP not Kool-amp. Every jar is registered, and I've given away a lot more than I've ever used.

The address on the jar is

8603 S.W. 17th Avenue
Portland, OR 97219

I'm sure they are still in business, they do a pretty large business with the Utility industry. However, I have about 20 percent of a pound left and can share if you can't obtain any from that address.

Evan,

Since its 120 vac I assume its a series 60 since they only list 1 120v model in the catalog. New price for those units is $234.

I would be interested in the responses you get. I have a number of Model 164 Dow Key units I want to sell.

Typical hamfest prices for Dow-Key relays run in the $25-50 range.
Nobody in their right mind would pay the current catalog prices for new
ones. Good new/used relays are quite plentiful, and not really an item
to plan your retirement around :-)

Well, I have been using the Cool-Amp product for something over 40 years. Sometimes extensively, plating such things as the complete circuit board for 2 meter converters sorts of thing. (And an occasional penny to demonstrate the procedure.) I usually just dampen my thumb under the faucet and dip it in the cool-amp and rub whatever sticks onto the surface to be plated. No gloves, it does darken your thumbnail for a couple days when you don't get it all off, but no worse than applying stain to a wall. I just made 70 years and as far as I know, haven't suffered from the procedure. (Who knows, If I hadn't used it, I probably would have given Einstein a run for his money.

The product is hydroscopic however, keep the jar sealed or it'll be a lump.

>
> Tim

Assuming the 1N4001 isn't simply introducing too much capacitance to begin with, this sounds like a Q problem. When you add more capacitance, the LC circuit becomes more capacitance-dominant. Normally this is not bad in itself, because conventional capacitors have much higher Q factors than inductors... but as a rule, even 'real' varactor diodes have lower Q factors than ordinary capacitors. I don't know what to expect from a 4001, Q-wise, but it's possible that it just exhibits so much loss at 7 MHz that it no longer effectively functions as a capacitor. When you allow a lossy capacitor (the 1N4001) to become such a dominant part of the LC circuit, the effective Q drops to the point where oscillation is no longer reliable.

You don't say whether you're using a Hartley- or Colpitts-derived oscillator; you might try playing with the feedback coupling capacitance(s) to see if that helps. In general, though, you don't want a low-Q tank circuit in a receiver LO. I think your best bet is to tear up an old FM radio or UHF varactor tuner and steal a legitimate tuning diode from it. If you have an ECG or NTE distributor nearby, they'll have a good selection of replacement varactor diodes as well. A 1N4001 is probably not the optimal choice for good noise and stability performance in an LO.

Yes, generally ... sometimes people, being people, make mistakes ...
in the case of modern design techniques, it is usually an error of omission
or an inaccurate specification from the requirements definition phase ...

> >The best of all worlds is an optimum mix of design, simulation and
> >experimentation. Invariably, I find that at least one loop-around

It is not at all uncommon in modern design to go from computer design and
simulation to production-ready hardware without a "traditional" (there's
that
word again ... the more I hear it, the more I'm convinced it's a synonym
for
"backward ways") breadboard stage ... modern product design/development
cycles are so abbreviated that the time involved in messing around with
breadboards (which often are not good models of the final product anyway
because of layout differences, etc.) is impractical and wasteful ...

> There is indeed a loop back and refit process in most things
electronical,

the
> '70s, made adjustment devices to allow fitting without rebuilding. They
called
> them trim pots. From the rants I have heard blasting me, I must assume
those
> ENGINEERS no longer use trim pots.

NOT IF WE CAN POSSIBLY AVOID IT ...
Good designs can, in many cases, allow for "worst case" component

tolerances
well beyond the specifications of the components used ... it's a matter of taking
the variations into account in the design in many cases.

And yes, most of us ENGINEERS are under tremendous pressure to eliminate ALL "tune at test" adjustments from our designs, because the labor to do the tuning
and the cost of the variable parts are prohibitively expensive ... things like trim pots,
variable capacitors, etc. are ONLY used when there is NO other way ... in many cases,
equipment is made self-calibrating ... or is calibrated once by an automated process at
the factory and the values are stored in on-board, non-volatile memory to be reloaded
at each subsequent power-up ... design techniques like this have replaced manual
tuning adjustments in many applications ...

Things have changed dramatically since the '70s ... obviously you haven't kept up
with the times ... but don't feel "like the Lone Ranger" ... there are tens of thousands of
other hams who are similarly stuck in a technological time warp and, like you, are blissfully
ignorant of how far behind they are ... THAT is the single largest problem facing ham radio
... and the insistence folks like that have on clinging to the code is both a symptom and an
exacerbating factor in this problem ...

Really, Bill? I think not ... just look, with a realistic eye, at the
level (or, more
accurately, LACK) of technical competence amongst that majority of hams.

Relative to technology, hams have (in general) have fallen farther and
farther
behind the SOTA over the past 20 years or more ...

> liquid or pastes are much harder to plate any thickness.
> 
> >
You are right and wrong on this guess; the layer is indeed more than 1 molecule thick and could be a few microns thick if done by this so-called "Displacement" method. What is happening is that the surface of the base metal (copper wire of cavity?) is going into solution and silver is depositing out. Whether this happens depends on the electrochemical potentials of the metals and these can be looked up in tables. What you will find is the method works for copper but not for a gold base (in fact in a gold solution, silver would go into solution and gold would plate out).
Where I must disagree is in the argument about thickness. In displacement plating one of the metals must diffuse through the other, for example, the copper must go through the already deposited silver, get to the surface and then go into solution. It simply is not going to go very far diffusing that way, at least at any decent speed, so the process just stops. In electrolytic plating this is not what is happening. An electron out of the power supply mates with a positive ion and forms a neutral metal atom which then binds to the surface. Normally a new metal ion is formed at the other electrode as an electron is stripped off one of the metal atoms there. This is not limited by any diffusion process in the solids (although the ions may be traveling in the liquids partly by diffusion, though simple mixing is more important in most cases, or forces from electrical potentials working on the ions) so it can go on "forever". Centimeters of metal are built up in some cases, like electrolytic refinement of copper.
There is a company offering a silver-plating bath which is likely not to be dangerous as it contains no cyanide; however, I don't have the

www address at hand and even hesitate to mention it for now because I cannot clear up a "misunderstanding" about the ability of the solution to plate onto copper. I have not been able to get a clear statement it will defintiely produce high quality silver well-bonded to a copper substrate and why it works when things I have read say it does not work from an acid plating bath!(the company "suggests" it will work but does not say "It definitely works on copper!") In cyanide baths there is a secret; the ions about which I wrote are not there except in very tiny quantities (one free ion per cubic centimeter is the order of magnitude). The cyanide gives up the silver bound to it at the critical moment, but does not give it up to the displacement reaction.
I should mention, metals deposited by displacement are often poorly bound to the substrate. I was experimenting yesterday and got a silver coat but when it built up a little in thickness it just peeled off, right down to the bare copper (this was in a bath with no cyanide and there was both electrolytic and displacement plating taking place.) My present interest is repairing a flute with ugly silver but those of you wanting to do electronics will not be any happier if the bond is poor as I expect poor electrical contact at the interface and thus Q is likely to be less than great.
I know people will be saying "What?!" when I make the suggestion, but consider gold plating. The simple truth is that gold is not such a great conductor and will not bring the benefits of silver plating when the silver is new, but those benefits are oversold anyway (Do you want to go to all that trouble for a 3% increase in conductivity?) In fact, in the past silver was sometimes overplated with a bit of gold. What is all this about? Gold does not oxidize nor does it react to make sulphides like those which form on silver. You may have a little less conductivity, but you will have all it tomorrow, and the day after, too. I once looked into an HP Q-meter and the whole works is gold-plated (Whether there is silver under the gold I don't know) in the critical places. Futhermore, gold has a more favorable chemistry than silver and it can be very well plated out of solutions with low toxicity. There are excellent, if expensive solutions on the market. A good supplier will charge you for the gold at international market prices on the date of sale plus a flat fee for the other chemistry and processing needed to produce the solution, feeding the workers, rent, mailing and phone calls, and all the other "hidden" costs. The greater part of the cost is delivered to you as gold in solution and it can be recovered at a later date. And you will not endanger yourself or the family while enjoying rf circuits with good performance over their whole lifetime!

Oh, well, I close, hoping it all helps to clear up some misunderstandings.

Bob

PS Though I try to make solutions to deposit silver, far better chemists than I have attempted to get around the cyanide and gave up. There are some known solutions which do work under reasonable

conditions, but cyanides remain the standard because they are much more flexible and tolerant than any of the alternatives. I even found a recipe for a bath depositing an alloy of about 80% silver, rest Cu. It is quite safe, but it would be a real flop for plating rf stuff as alloys are almost always inferior in conductivity except if you go the route of superconductors! Even then, the best rf work is done with pure niobium, I believe. Anyone for rf at liquid helium temperatures? (Stop the government from venting this precious resource into the air!)

Yes I have heard of this too, I think you would find it would be thicker
than 1 molecule though! You'd be very hard pushed to even see it! I
think electroplating is much thicker because of the electro deposition
process thats used, you can control the thickness much easier. The
liquid or pastes are much harder to plate any thickness.

Photographic solutions do work for minor silver plating! There seems to be two tricks that help. First, be sure that the surface is clean and secondly, be sure that surface remains away from the air.
One item that cleans well is any phosphate product used to remove lime from bathroom surfaces. Scrub the object to be plated with a non-conductive pad. Then immediately, after rinsing well, plunge the object into silver laden photo solution. After a few hours you will probably see a darkened surface. Most of the silver will rub off but a small amount will remain---probably enough to do some good. Cliff K7RR

True. It's also a little low for SSB activity (here mostly 28.4-28.5 MHz). However, I'd still say that you'd have better chance of success on phone than CW on that frequency. You could add a 741 mic amp, a NE602 balanced modulator and 3 or 4 transistors to get QRP DSB on 10m.

However, bear in mind that with QRP, crystal control has a similar effect to putting a 20dB attenuator in line as regards the number of QSOs you'll have. With frequency agility you can at least call other stations calling CQ, with crystal control you're stuck to calling yourself, hoping that someone else will hear you. I have some more thoughts on crystal control Vs freq agility on my home page (URL below).

>mailto://hink@scioto.net/

David - the regulations may be different where you live, but here all CB
CB gear must be type approved. Thus if you want to build something and
legally use it, you'd have to get your Novice ham ticket and get
something going on 28 MHz. There SSB is almost mandatory, unless you
wanted to experiment with FM, AM or CW.

Having said the above, I'd start with an AM-only car radio and build a
simple two or three transistor converter. That would allow coverage of a
1 MHz range. Of course you'd need to add a BFO for SSB reception.
Selectivity won't be the best however.

For a transmitter, you'd need to decide whether you want frequency
agility or crystal control. If tyhe latter you have to decide between a
VXO (which could cover about 50 kHz on 28 MHz) using a fundamental
crystal and a multiplier and a 3rd overtone xtal osc on a single
frequency. Then have a few stages following to boost the output up to a
reasonable level. For an AM modulator, you may be able to use a LM386
audio amp (probably with a preamp before it) for rigs up to about 1 watt.
You might be able to use an AM radio speaker transformer for the
modulation transformer (which is in the DC line of the final amp stage).

Yes, I found it in the "C" section. They are now on Boons Ferry Road in
Lake Oswego, OR, much classier digs. (503)624-6426

Also, info might be useful for anyone else thinking of building small loop
antennas. I was going to silver plate the 3/8" copper tubing- it is 3ft in
diameter, but on second thought, I really want to control the Q, rather
than make it sky high. Otherwise, I'd need to use vacuum variables for the
tuning cap.

As it is now I have this huge broadcast type with 4 sections of I guess
around 300-400pf each. Two sections connect to one side of the loop, and
the other two to the other side. Thus its balanced. With 100 watts and
shiny copper loop, I only get arcing very occasionally. If I make it
silver plated, I might not be even able to use it. But I might silver
plate it and then use a resistor to control the Q.

As it is now, loop and cap only get slightly warm on 40M. I'll try 80 and
160 eventually with more cap in parallel. And I was suprised to have no
TVI and no rf on chassis, even though I had it on my bed and TV in next
room. This also makes a great SWL antenna since it can be tuned from
7-30mhz with just turning cap knob.

Rob.

Hi:
If anyone is looking for 15A or 30 A DPDT (double pole double throw)
knife switches with a 250 VAC rating or higher, you can find them in
Japan of all places.The blades are separated by about 40 mm. The blades
are fully enclosed making the switch safer than the traditional, fully
exposed knife switch, the the switch also has a center dent position.

I just picked up one in Akihabara for 1080 Yen + 5%
sales tax, which at 120 yen to the US$ is about $9.45 I have seens adds
in QST for knife switches for much more. Apparently, in Japan, knife
switches are stilled used in household and also industrial circuit breaker boxes.
The DPDT switch is rare but it is available at most large electrical
parts stores.I plan to use my in my balanced antenna tuner to switch
the location of a capacitor in the "L " match circuit.
Perhaps you could get a friend who is visiting Japan to pick up a few, or
try convincing a large importer to bring them into the USA.

A lot of bright young folks get their engineering and science careers started via amateur radio. Very many of them later on move into specialties that are not closely related to amateur radio. Many of these folks maintain an interest in amateur radio, but don't have the time or specialized knowledge, and quite often also no desire, to be at the state of the art, amateur-radio-wise. They are content to buy their gear and operate it when they have time and to be knowledgeable only enough to do what they want to do. That is OK, I believe.

The internet has become a hangout for others who have strong technical interests. I think that is great. The usenets have become a kind of "virtual hamband" for techno-hams. It is almost impossible to get these kinds of forums on the real bands. We even seem to have a "virtual 14.313".

But in our enthusiasm for the more technical aspects, we should maintain a tolerance (appreciation) for the less technical types. I have a special feel for the many retirees who like to get together in the afternoon, for example on 20/40/80 meter CW/SSB, etc.

There is a much more noise immune approach that is more analog. Build a pair of narrow band filters that detect each of the carrier frequencies, and detectors that convert magnitude to DC level. Also, build a double notch filter that passes all but the two carrier frequencies, and convert this to dc level. Then compare the level representing each carier to the background level. The bit rate is limited by the roll off of the low ppass filter that produces the DC level from the rectified signal. Higher roll off, allows higher baud rate, but is less noise immune. Straight trade off. All the filtering (bp notch and lp) can be performed by switched capacitor digital filters, rather than op-amp versions, if desired.

The digital approach you are using looks much simpler, until you do all the analog things necessary to let it work in a real world noisy environment.

There is a method of silver plating that I've used for many years,
and which I haven't seen described recently. It involves rubbing on
a silver salt-containing mixture. I've used it to plate coils and
ribbon conductors for homebrewed tuners and amplifiers, and it has done
a surprisingly good job. My current amplifier, using a pair of 4-400's,
is sitting here looking as shiny as when it was built almost 20 years
ago.

The mixture is a dry powder comprising 1 part by weight of silver chloride or silver acetate, 3 parts sodium chloride (common table salt) and 2 parts of cream of tartar (potassium acid tartrate) which can be found in the baking ingredients department of your supermarket. They should be mixed well and kept dry. It is a stable mixture; I've had some around for over 10 years and it still works as well as it did when first mixed. So far as I know this mixture presents no serious hazard, and it does not stain the skin as silver nitrate does. Regardless, I still use vinyl gloves when using it, and it's always wise to take precautions against inadvertent ingestion or inhalation.

Although I have plated coils that were already wound, it's much easier to
plate the wire first. My amplifier coils were made from #10AWG solid building wire, first straightened and then cleaned with very fine steel wool. A generous pinch of the powder is applied to a piece of *wet* paper
toweling or cloth and rubbed onto the wire until there is no hint of the copper showing through.

I've never seen any sign of the silver loosening, and it seems to be holding up on an ARC-5 rotary inductor that I replated and have been using in an antenna tuner for several years. Of course, that's a rotating contact; I wouldn't recommend it for sliding contacts.

If you are just using the silver plating to prevent corrosion, not for better conductivity, perhaps tin plating would work as well. You can buy commercial tin plating solution for use on copper-clad PC boards after etching but before any solder mask is applied. It exchanges copper for tin atoms on any exposed copper surface, but probably doesn't build up any significant depth of tin. The resulting tin layer is probably more corrosion-resistant than silver.

On the other hand, if you *do* want better conductivity, you want a significant thickness of silver. Just exposing the copper to silver salts in solution won't do this - you need electricity to deposit more silver once all the exposed surface is silver.

:
:Am I missing something? Do I loose somthing by doing this?
:
:
:Tim, ka8ddz

Caught up in reading all the nonsense (including my own post :) I forgot to actually answer the technical question.

If you can find a two or three ganged variable cap with equal sections, you can make that into a great front end filter. If you put an inductor (e.g. 20T on FT50-6 toroid) in series with each cap section, then put all 2 or 3 tuned circuits in series, and then add a coupling inductor(e.g. 4T on FT50-6) from the node between each series tuned circuit to ground, you will have a nice Cohn filter.

Without doing any calculations, you can hook it up and find what bands it will resonate on. Then if you want higher freqs you can make all of the inductors smaller, or if you want lower freqs you can make them bigger. Or if you want wider BW, you can make the coupling inductor(s) bigger.

Finally, after doing this intuitive type of construction exercise, you might even be enthused enough to do some reading on filters. The nice thing about the Cohn filter is that the caps and each series of inductors are equal.

Since the inductance remains constant as it is tuned, the BW will increase in proportion to the resonant freq. But that works out well since you really need the narrow BW more on the lower bands anyway.

You could even replace each tuning cap section with a bunch of paralleled varactors. I have a module in a receiver that uses 3 relay switched varactor Cohn filters. Covers 1.8-30mhz and does not compromise 110db dynamic range. But it uses as many as 20 or more surface mount varactors

to make up one tuning cap. Still, a preselector like this could be made very small, one thing thats hard to do with a big variable cap.

Have fun! Rob.

Hello,
Does anyone know where I can get this neat little kit? It's a
CW transceiver that fits into a Tic-Tac box, sorta comparable to the
NorCal 49'er. It's supposedly distributed by HSC Electronics (at
http://www.halted.com ), but they haven't yet responded to my email.
Does anyone have an unbuilt (or even built for that matter, as long as
it works) kit that they owuldn't mind parting with? Please email me
at: vcs@ix.netcom.com

Thanks,
Vince Scoglietti

Amateur Radio is big enough to accomodate every interest. How sad that amateurs seem to feel that only people who share their interests are the "true amateurs". It reminds me of religion where each sect thinks it is the only true holder of the faith and that everyone else is wrong and on a path to hell - The truth is that they are all probably wrong (at least to some degree) ;-)

Mark.

CASH GRANTS CASH GRANTS CASH GRANTS

Foundations all over the United States GIVE CASH GRANTS.

ANYONE can apply for a Grant from 18 years and up...

This money HAS to be given away, WHY not to YOU?

Grants from $500.00 to $50,000.00 possible, in some instances.

Grants don't have to be paid back.

Grants can be ideal for people who are or were bankrupt
or just have bad credit.

Get the money you need to start that business, you have always wanted.

To get your list of FOUNDATIONS that give grants, AND instructions
on how to apply.

Send a check or money order for ONLY $6.00 to:

> thru the holes?

I don't know how I would do it at home. In a board shop, they do what is called electroless plating, basically dipping the board in a solution or suspension of fine copper particles before it is etched but after it is drilled. The copper particles adhere lightly to the surfaces of the board, including the shafts of the holes. Takes some specific chemistry in the solution to make that work, but it does work. The boards are then plated with copper, more copper, that is, and the holes end up with half an ounce or so of copper plated into them. The next step is to clean off the resist that had been screened or photoplotted on the board. Under the resist, the copper is thinner. Etching will remove all the previously resist-covered copper but only half the bare copper areas that had been thickened by the plating. The board is done.

good luck.

Given any two arbitrary tones, and the need to retune, yeah, this is
the easy way to go. If you're trying for DTMF (Touch Tone), though,
don't overlook the SSI-202.

# 1737. 11 volts from 12 volt regulator?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-11 00:00:00 UTC
From: wmeara@erols.com
Message-ID: <33eee2f0.2703518@news.erols.com>
Source record: 91815

I just put the finishing touches on my (supposedly!) 12 VDC QRP station power supply. Circuit is VERY simple: 18 volt (2 Amp) tranformer to a 2000 Mfd (50 Volt) filter cap to a Radio Shack 7812 12 VDC voltage regulator.

Problem is that the output voltage is only about 11.1 volts.

Has anyone seen this problem before? What do you think, bad component?

I also notice that the regulator gets quite hot. I put a fairly large heat sink on it and I don't seem to get to the thermal shut down point (even when pulling around 1 amp through it.)

Any suggestions?

Thanks, 73 Bill N2CQR

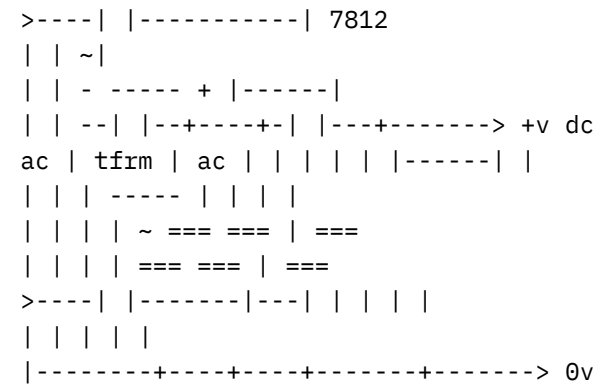
>Thanks, 73 Bill N2CQR

Probably because of the high ripple content coming from the capacitor.

Did you use a rectifier after the transformer? A simple C across the
output of the transformer really won't do the job

Rectify it and then smooth it and I think you're away! The regulator
shouldnt get that hot, also remember a 1uf tantulum across the input to
ground and across the output to ground, this will stop any oscillations
in the regulator.



(yours) (add in)(yours)(add)(yours)(add)

Hope that helps, and might explain why your reg is hot!

: Hello Wes.

: I have read that they always operate in the series mode.

Hmmm....interesting. I have a commercial overtone oscillator circuit
for which I order crystals from International for parallel (overtone)
resonance, with a very low value of load capacitance, and things
come out on-frequency. International doesn't seem to have any
trouble understanding "parallel-mode overtone" and associated
load capacitance...and the calibration suggests that it really is
that mode.

: I have a quote from the book "Crystal Oscillator Design" by Frerking:

: "Overtone crystals are nearly always operated at series resonance".
: There are also circuit examples to verify.

Glad I didn't read that before ordering crystals, or I'd have been
rather confused about the calibration, I think! Given the 10pF or
so load capacitance, there's quite a difference between the parallel
and series resonance frequencies.

(I don't mean to be argumentative about it, it's just that I have
an overtone ckt that really does seem to operate the rock in parallel
resonance. There's really nothing special about the circuit; it
even has a trimmer for netting the crystal.)

Because an approx 50 MHz crystal is expensive ie $20, is it possible to say use a 17.73 MHz crystal and use its third overtone ie around 53 MHz. As this crystal is only a few dollars.

I have a siimple schematic for a crystal osillator, but do you have to do anything special to the circuit to make sure you get the third overtone. Or

Check out Phillips app. note #1983 (http://www.semiconductors.philips.com/acrobat/8025.pdf) for a pretty good overview and introduction (IMHO) to crystal oscilators. Hardly a theoretical reference, but good enough for practical use.

Radio Shack sells Cat. No. 28-177 ($6.99), which is an AM broadcast
crystal receiver. It includes a ferrite rod coil, some antenna wire,
a diode, a variable capacitor, and a high impedence earphone.

It's not a great buy, but I've seen worse. Some individual stores
might not have them in stock, but in any area you can probably find
several kits by calling around.

I can't help with the output voltage, but the heat seems about right.
You don't make the DC input to the regulator clear but at 1 Amp it
will have to loose 1 Watt for every volt difference between input and
output.
With 18VAC into a bridge rectifier you could throw away the heat sink
and use it for soldering. :)

>is $99.00. It's well worth the money.

Save your money and put it to better use. An "antenna tuner" is practically worthless for shortwave listening. Sure, it seems to bring signals up 3-4 S units, but it's also bringing the noise up 3-4 S units as well, and signal-to-noise ratio is really what determines what you can and cannot hear.

Modern receivers have plenty of gain. As long as the antenna brings in enough signal so that it's above the receiver's noise floor, antenna tuners and preamps can do more harm than good. I wonder about the quality of the preamp in the MFJ. Probably far inferior to the front end of your Kenwood.

I suggest that you see this for yourself by doing A-B tests with the tuner in and out of the line. At the most, the tuner is acting as a rather poor preselector, which is too bad since most receivers these days lack selectivity more than they lack sensitivity.

If the voltage is low during low current draw, I'd try another regulator. Actually, the spec on many brands of three-terminal 78XX series regulators is +/-10% so you are within tolorance. You can probably hand-pick one or prop up the common terminal with a silicon diode (raising the output by 0.7 volts).

I also notice that the regulator gets quite hot. I put a fairly large
> heat sink on it and I don't seem to get to the thermal shut down point
> (even when pulling around 1 amp through it.)

Bill-

To start, 1.414 times 18 volts RMS equals about 24 volts DC. The
difference between 12 and 24, or 12 volts, is dropped across the
regulator. Power dissipated would be output current times 12, or 12 watts
for 1 Amp load current. This may exceed the regulator's ratings, and
would explain an unusually high temperature. However, if there is any
noticeable rise in temperature when there is NO load current, then you
have a defective regulator.

Getting 11.1 volts output is poor, but may just be the result of being on
the low side of tolerance. If everything else checks out OK, you might
try connecting a rectifier diode between the common terminal of the
regulator, and ground. Result would be 11.1 plus 0.7, or 11.8 Volts
output. Two in series would raise it to 12.5 Volts. If this doesn't
appear to work, then try connecting an additional 1K resistor between the
output terminal and the regulator's common terminal, to ensure that the
diodes are forward biased.

Bob Mueller <r.mueller@kfa-juelich.de> wrote:

> On account of little "end effects" the overtones will not be at
>exactly the harmonics of the fundamental, whether in a quartz
>oscillator, a plucked string or a blown flute unless measures are taken
>to fix the "errors".
>
>Bob

This is not a correct analogy. A piezoelectric resonator is
fundamentally different than a purely mechanical resonator like
a musical instrument. The reason why the overtone is not an
exact multiple of the fundamental is as follows: When an
electrical stress is applied to the crystal, it generates a
mechanical strain. This mechanical strain in turn generates
its own electric field (since piezoelectricity works both
ways). The electric field interacts with the applied electric
field. This effect is small, because quartz is only weakly
piezoelectric. The effect shifts the fundamental away from
the unperturbed resonant frequency. Overtones are shifted
less because the inner regions have purely mechanical resonances.
To this extent, you could say "end effects" are involved, but
they are not really "errors" you can take measures to fix.
It has been said that piezoelectricity in general is an
end effect.

If you take quartz resonators and excite them mechanically
only, then you will find that the fundamental and overtones
are exact integer multiples, except for end effects like
mass loading due to the electrodes.

In materials that are more piezoelectrically active, like Lithium
Niobate, this effect is much more pronounced, an the overtones
are nowhere near exact integer multiples of the fundamental.

For further information on this topic, see Harry Tiersten's
classic papers on the subject written around 1960.

Bill,

Try converting to an LM317 device, caclulate the needed resistor values
or use a chaeap pot and you can have exactly 12 volts or 13.8 or what
ever you like for a few cents worth of resistors. Been using the LM317
unit for years with cheap 1 percent metal films to get within less than
1 percent most of the time and not the 10 percent junk that comes with a
lot of the 7805 floor sweepings that show up from both the big time
suppliers and the convenient local shops... Watch the watts though as
the other postings warned.. Heat Sink BIG and you will probably be ok
even withe big drop...play with filter cap values a bit to let the
primary DC source sag a bit to drop the regulator diss a bit..not the
best engineering, but ok if you can make it all work.. the regulator
will eat the ripple....

Good luck

Bob, KE6F

Hi Grant,

I have Dow Key relays from the 60's that I have never used, since most of my operating is at HF and a small open frame relay works just fine. I've taken them to hamfests, and never been able to sell them for 20 bucks.

I think the prices you mentioned are fair for "like new" relays, but I would think the demand is pretty small now that Viking 500's and HRO-500's are not used much.

Hi, Tom

Actually, with the resurgence in interest in operating these fine old radios, the demand has actually been quite strong among vintage gear ops -- like myself :-)

Most of the "big rigs" like the Viking 500 and Globe King have antenna transfer relays built in. But rigs like Viking II's, Rangers and others need the external relays. Of course its always possible to build something up using a standard 10-20A modern relay, but such contrivances lack the right sound(?), smell(?), something undefinable(?), and the Dow-Keys were de rigeur in the timeframe :-)

: or 100s of MHz? These devices don't seem to have listed their maximum
: operating freqs. Any ideas?

When I was at Drake, there was discussion of this. At the time, opto isolators were extremely nonlinear devices; they tended to square off the envelope. This was a long time ago.

I would be more interested in fiber optic cabling between modules, to reduce transient mixing products. I can never shield stuff well enough. What sort of linearity do fiber couplers have? I hear about them only in digital apps.

If there were real linear items, it would be intriguing to have a two-part trasceiver; a chunk at the feedpoint and the first mixer, audio, and control stuff on a CPU card. It would really reduce the RFI problem of the computer.

Although, putting a lot of electronics in a lightning-prone location might present a problem.

Just go to DigiKey ( http://www.digikey.com ) and by a 50.000MHz sine
wave oscillator for 2 or 3 bucks. I doubt whether you could tweak
the third harmonic down 3MHz from 53 to 50 anyway.

Alan - I don't think you can go past the MC3362. A receiver for 2m FM was described in Silicon Chip (March 1990 - give or take a year). Dick Smith sold a kit for several years - they may still have stocks left - cost is around $60. I built one to use in a homebrew 2m rig and it worked very well. The chip contains all of a dual conversion VHF FM Rx. I found the IC's internal varicap diode oscillator OK, though you may want to have a xtal controlled osc/multiplier chain instead.

# 1769. Battery Charging Circuit Needed

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-11 00:00:00 UTC
From: Stephanie Steele <kc7dba*NOSPAM*@primenet.com>
Message-ID: <33EF1FA6.44FB@primenet.com>
Source record: 91910

I am looking for a battery charging circuit to use on our clubs ARES repeater backup batteries that will charge at a high rate (15 amps) when AC power is restored and drop the charge rate as the batteries approach full charge and finally shut down when at full charge. We have looked into commercial versions of this but they are outside our budget. Hope this explains better what I need.

And here is my 2 cents worth:

I like to use a small butane torch to solder them on, it may take
you one or two connectors to learn that they heat up a LOT faster than
with almost any type of iron, but be quick and it does a fine job. I work
on marine electronics in the summer time and it has the advantage of
being cordless, also it is much easier to use when you are outside and

there is a breeze blowing. My torch is made by blazer, costs around $30 from various tool companies. My first torch did not have electronic ignition and it was a pain to light, especially when it went out in the middle of using it. This one has pezio ignition and I don't think I will ever buy one without it again, it is that handy.

Hope this helps N9OHS

I have for sale a brand new PRO-2045 Scanner from Radio Shack in the box. I thought I'd be able to hook it all up but do not have the time and prefer to focus on SWL. The price is $200.00 and I will pay the shipping. I will accept a Money Order, Bank Check, or COD if your prefer.

Thanks,

Gary-

I too have used a torch to do this. It was one of the pencil type that you
can use a soldering tip with. I dropped the tip while up a tower and just
used the flame. Worked great . Don't think it would have gotten hot enough
using the soldering tip. Never considered this as a standrad way of
putting them on, but why not.

Whats the input voltage on this thing. I think to get them to work right
you need at least 2 or 3 volts more input than you are expecting on the
output. If this is OK I'd get a new regulator.

Thats 2 or 3 volts if you are working from a nice stiff source. If you
input is not regulated make that 5 or 8.

How much would you like to bet that your voltmeter is in error? What does your voltmeter measure when you put it across your car battery with the motor not running? If it says anything other than 12.6 volts, then perhaps your voltmeter isn't in calibration.

How could their be any silver in photographic developing solution? The silver is in the emulsion. If you want silver in your developing solution you have to first develop a hell of a lot of prints or film. OK?

There is no significant amount of silver in the developer. But the
suggestion was to use fixer, not developer. In black-and-white
photography, the black areas are made up of metallic silver, but
the fixer removes the silver from the clear areas. In colour photography,
there is no silver left in the emulsion - it all ends up in the fixer.

Now, fresh fixer has no silver in it. But exhausted fixer has plenty
of silver ions in it. Yes, you have to develop a lot of paper or film
to get the fixer exhausted. But anyone who uses or runs a darkroom
will have access to exhausted fixer.

You'd be surprised how much heat a little portable butane soldering iron
puts out in "soldering iron" mode as well as "torch" mode. I normally
use a temperature-controlled 40 W iron for soldering. When that doesn't
put out enough heat, I switch to a 140 W soldering gun. And when *that*
doesn't provide enough heat, I dig out my little butane-powered Weller
soldering iron. On "high", it seems to put out more heat than the gun.

Hi Vince. The pixie2 is described in detail, with all original
text and graphics on my web page. I have obtained permission
to display these, however they are copyrighted.

The pixie2 is easy to build. I bought one at Haltec for $9.95
+ tax. It was so easy, I built a second one that day from
spare parts I had. The second one was ground plane construction
and even works better than the first (PC Board)!

Haltek has them for sure.

Good luck and visit my page (In signature file below).

I didn't see you reply posting Bill, so I'll tack one on here.

Your quote afirms my comment. "Nearly always" isn't "always" :))

Using your reference (Crystal Oscillator Design and Temperature
Compensation, 1978 issue), for example see page 70 for "Overtone
Pierce Oscillator".

There isn't any fundamental (excuse the pun) reason why series
resonance is the only possible mode. If there is a series resonance
at the overtone, then there has to be an inductive region where
anti-resonant operation is possible.

From: wmeara@erols.com
Message-ID: <33efbc98.11731760@news.erols.com>
Source record: 91841

Thanks to all who sent advice on my regulator problems. First, let me confirm that I did indeed have a rectifier in the circuit! Full wave bridge rated at 4 amps, 50 volts.
Transformer has an 18 volt secondary. (There is a center tap but I'm not using it.) The circuit I'm using is essentially the one on page 239 of QRP Classics (minus some of the caps and the RFC).

Following some of the suggestions posted here, I went ahead and put bypass capacitors on the regulator's input and output (hoping to suppress any oscillations that might be present). No luck. Still got 11 volts out. (I've measured the same voltage with two different meters - one a VOM and the other a VTVM.)

I'm thinking that I simply bought an 11 volt regulator in 12 volt clothing! Tomorrow I'll try a new part (and will report back on results).

Thanks again. 73 Bill N2CQR

It depends on what you regard as the stub. Some people only see the quarter wave rod as the stub, but I think the entire bottom quarter wave is a impedance matching transformer, to transform from 50 Ohms to high impedance, while the top half wave is acting as an end-fed dipole. Right?

See also pages 71-73.

Further reading of the Frerking reference and also Terman 1955 says that overtone xtals are often prone to spurious modes and that the series circuits help to prevent the tendency to oscillate at those frequencies.

Also, if we look at the circuits that are used. xtals oscillate somewhere above the series freq and below the parallel freq, where they are slightly inductive. I don't believe that any of the commonly used circuits operate exactly at the parallel freq, but rather at the freq that has the correct loading capacitance.

In series mode oscillators a series cap is often used to adjust the series resonant frequency. The thing to look for is a very low circuit impedance between the xtal (plus its series cap) terminals at the desired frequency. The Butler overtone circuit is one famous example. Also the impedance inverting Pierce.

Also, I believe that "nearly always" is somewhat more emphatic than "usually".

This is a difficult subject to be precise about, and there are a lot of contingencies involved that I have not studied very carefully, so I am trying to be not too authoritative. But I think the basic principles are pretty clear.

Hi Bill.

Reminds me of the customer who wanted a 12 volt power supply. When I asked him the tolerance, he said "none. Exactly 12 volts." I had to admit that I didn't know how to build one of those.

While true that the Colpitts with the crystal base to ground wants to oscillate well removed from the resonant frequency of the rock, placing it (the crystal) in the feedback loop between the divider capacitors and the emitter (Colpitts again) allows operation at the resonant frequency. (Or, is that "Much closer to the resonant frequency?") Of course, it'll oscillate without the crystal too if you just install a series resistor there.

I gave been doing some more reading in Krauss, Bostian and Raab "Solid State Radio Engineering". Also the 1995/6/7 ARRL Handbook has a very nice writeup by David Stockton in chap 14..

There are several frequencies that can be marked on a xtal can:
1) The series resonant frequency.
2) The parallel resonant frequency, involving only the xtal and its holder.
3) The series resonant frequency with a capacitor, say 30 pF, in series.
4) The series resonant frequency for an overtone xtal.

K, B and R say the overtone xtals are "always" used in circuits where the xtal operates in a low impedance series mode. Reason is it's much easier to prevent spurious modes.

Where an xtal oscillates depends on the circuit that is used. Some circuits oscillate at the series freq, most others somewhere between the series and the parallel freq. If the xtal is labeled with the series freq then we need a series circuit with no series cap if we want that freq. If it is specified for 30 pF then that is what we need. If we use the series cap in a series-type circuit the freq is quite close to the parallel resonant freq (ref. K, B and R).

For example, a fundamental mode Colpitts without a series cap works very close to its series freq. If we put 30 pF (net total value) in series it works very close to the freq marked on the can, I have noticed.

In most circuits the xtal is inductive, for example the Pierce, in order to resonate with circuit C. If the total circuit C that is across the xtal is exactly 30 pF (or whatever) then the oscillation is very close, but probably not exactly, at the freq that is marked on the can. The xtal reactance (therefore its freq) will shift a little in order to compensate for phase shift in the transistor or IC.

I have seen several cases where the xtal vendor uses the customer's circuit to grind and test the xtals.

Bill W0IYH.

According to National Semiconductor Handbook, the 7812C output falls between 11.4 and 12.6 volts (5%) over temperature and 11.5 to 12.5 volts with a junction temperature maintained at 25 deg C.

The 78L12AC is +/-5% and the 78L12C is +/-10% or 10.8 to 13.2 volts over temperature and 11.1 to 12.9 volts at 25 deg C.

Source record: 91853

We should not regard parallel and series operation as modes, they are simply convenient words to describe the circuit condition. There is a continuous range of input conditions that will modify the crystal frequency from below series resonance (inductance in series with the crystal in a zero phase amplifier) to above series resonance (capacitance in series with the crystal) .
An overtone crystal will generally be operated away from series resonance either because the series circuit is not perfect or to make fine frequency adjustment. Operation above and below series is a good idea as thy dont pull well and there are few spurious responses below series resonance.
Note
Overtone crystals do not pull as easily as fundementals they pull approximately 1/nsquared of the equivilent overtone ie a third pulls 1/9 of the fundemental.

Kc> Subject: Battery Charging Circuit Needed
Kc> Date: 11 Aug 1997 07:19:00 -0700

Stephanie,

What you want is a major charger.
I am still curious about the specs.
Do you want the ARES repeater to be instantly powered by this
charger/battery compination when power fails, then when power
returns after...even days of operation, and the batteries are
near/or below voltage to operate the repeater, for the
repeater to instantly return to operation, powered by the
120, and the batteries to begin receiving charge, up to full charge?
During this time, what is the permissible ripple on the
nominal 12volts from the charger?
How much of the parts to you have on hand?
Transformers, etc?

What commercial battery chargers have you priced,
that were out side the budget....what was the price/budget?

Kc> I am looking for a battery charging circuit to use on our clubs ARES

Two comments:
1. The regulator you selected may be too heavily loaded to supply the spec'ed output voltage. 11.1 is about 8% low, so would be out the the more typical 3-5% tolerance.
2. You can probably "jack up" the output voltage of the regulator by putting a diode in series with the ground pin. This effectively elevates the ground by one diode drop ~.7 volts which should raise your output voltage by the same amount. With respect to the thermal dissapation, this will lower it by a small amount (.7 * output current).

Good luck.

>signal-to-noise ratio is really what determines what you can and cannot hear.

You are absolutely wrong. The tuner DOES work. It does an excellent
job on bands that the antenna is not resonant on. My antenna is cut
for the 41 meter shortwave broadcast band. On this band, yes, the
tuner does very little. (The preamp does bring in the weak signals,
however and the attenuator is usefull for the too strong signals.) I
listen on frequencies from 160 to 10 meters, and this is where the
tuner is outstanding. It DOES bring up the signal strength 3 or 4 S
units. It DOES NOT bring the noise up.

>Modern receivers have plenty of gain. As long as the antenna brings in enough
>signal so that it's above the receiver's noise floor, antenna tuners and
>preamps can do more harm than good. I wonder about the quality of the preamp
>in the MFJ. Probably far inferior to the front end of your Kenwood.

Wrong again. Using the preamp, I can hear signals that were not
readable without the preamp.

>I suggest that you see this for yourself by doing A-B tests with the tuner in
>and out of the line. At the most, the tuner is acting as a rather poor

I did extensive "A-B" tests when I received this unit. There is a
large performance gain with the unit.

Paul;
In the past when I had to replace hard to find belts I went to the stores that sell vacuume belts.(took the broken belt with me). If that did not solve my problem go to a large plumbing supply house and check out "O"rings. If that fails take an old inner tube and cut what you need. Been there and done it. It may not l;ook pretty but it works.

The J-pole should be a little better than a dipole. The only one I ever
built worked very well.

For a quick dipole, get some RG58 coax and strip off the outer jacket up
to 48cm from the end of the cable. Then make a small hole in the exposed
braid near where the outer jacket starts. Bend the cable and pull out the
inner conductor. end the braid back along the coax. Hang the antenna
up somewhere by the end of the inner conductor. Your dipole's finished.

Not True. This is folklore spread by those selling j-poles.
In the real world the best simple omnidirectional vertical antenna
is a ground plane, e.g. mounted on a flange socket.

Know of a case where a guy used a regular automotive alternator to do
this. He had to build a custom regulator for it. Talk about big current
he used the damned thing for welding among other things. Think this is
not uncommon, someone out there should know how to do it.

# 1811. Ceramic Insulators needed

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-08-13 00:00:00 UTC

Please get out your rulers and look in your junk boxes.

I need two or three ceramic insulators 1 3/4 inch x 1/2 inch cylindrical. They normally have holes in the ends tapped for either #6 or #8 x 32 screws. ( I need these to support the rear of a band switch in a hf amp.)

Alternatively: does anyone know of a source of such insulators...even new ones?

Thanks,

Paul Helbert, Wv3j

Look up a Zepp Match or Zepp (Zepplin) Antenna in your various Reference books
